never changes, the measured SWR null frequency measured at the radio
will. This is very easy to see.

This shifting of the apparent SWR null point is explained by the
action of a 1/4 wave section of coax and how it can interact
with a non characteristic impedance load.

Posted also is a JPG chart that best shows how all of this works.
Perhaps you should introduce this at the Academy for future
reference.

I will post the JPG on alt.binaries.radio.pictures

Source record: 37942

The tragedy of this is that some of these guys actually believe this bullshit. If 'most' amateurs were operating over the legal limit, then there might be some amps sold or resold on the market that were capable. There aren't. The largest single manufacturer of amps for the amateur market is Ameritron/MFJ, and the bulk of their equipment runs on 572b, 811, or 3-500. Even a pair of 3-500's will not exceed 1.5 kw on a good day. Henry? Who buys a Henry except a CBer? An amateur with a Henry is a novelty. If you actually believe that 'most' amateurs are doing this, then where are the amps coming from? They aren't home brew for the most part, so tell us, where? A friend of mine operates barefoot and has for many years. He has 327 countries confirmed with 100 watts. What does he need an amp for? Something with 1 kilowatt would be nice to break a pileup to a rare dxpedition, but he is patient and as the pileup quiets down, he works the station. This is just another concocted excuse for a few of the boys on this newsgroup to do some back slapping and try to convince themselves that what they do is OK because operators in other services are permitted more power.

JarryLaw wrote:

> wavelength.

I downloaded the image and now understand the problem with your interpretation. By the way, note that the chart lists terminations in "resistance" and not "impedance." This chart is fully accurate only when the termination is a pure resistance with no reactance. When a reactance is introduced into the termination, you have a 50:50 chance of the chart being correct.

Let me give an example of how the chart does not work with a reactive termination. Consider an antenna impedance that has a resistance a little on the high side with some capacitive reactance. Let's say an impedance of 60-j20 ohms. Let's watch the input impedance as we vary the transmission line length.

Length (degrees) Impedance
---
0 60-j20
10 52-j21
20 45-j19
30 40-j15
40 37-j11
50 34-j7
60 33-j2
63 30
70 34+j3
80 35+j8
90 (1/4 wave) 37+j13

Note that the reactive portion of the impedance went from capacitive to inductive at 63 degrees (significantly less than 1/4 wavelength).

If you attempted to (mis)apply that chart to our capacitive impedance of 60-j20 ohms, you would not expect the capacitive

portion of the impedance to start approaching zero until the coax length passed 1/4 wavelength where the chart shows some series inductance.

What that chart *does* show is a lumped element (resistors, capacitors and inductors) equivalent impedance of a distributed element (transmission line) circuit terminated by a non-reactive impedance (resistance only). These equivalent circuits replace *both* the transmission line *and* termination. They are not a substitute for the transmission line only -- this is how you are applying it. You do not put these equivalent circuits in series with your termination; they are your new termination replacing the transmission line and old termination.

I'll be happy to answer any questions.

4374. Re: Amps

Newsgroup: rec.radio.cb

<< Spend some time listening on the bands as i do, you may be surprised! >>

On the bands you "listen to" the hams must evidently announce to the world that they are running 3, 4, and 5 KW. If this is not the case, then your facts are highly questionable.

Of course I hate labeling people unfairly but there is a "CBer mentality" very much in evidence in your writings. To wit:

*You can't seem to comprehend that, even though they are licensed to run ten times more, the majority of hams typically use 100 watts.

*You assume that DXers who "sound" loud in a pileup MUST be using illegal amounts of RF power.

*You don't understand that in the mind of the average ham, risking their license, running up their electric bill, and stressing their expensive amplifier tubes in order to gain one or two S-Units over S-9 is a thoroughly ridiculous concept.

* You assume that the object in ham radio is the same as in CB: i.e.; to be the loudest and cover up everyone else.

* You can't grasp the operational advantages of running a robustly designed (legal limit plus) amplifier well below its limits.

On the whole, I find your arguments specious and your logic flawed. The existence of "bad apples" in the ham barrel is a very poor excuse indeed for running excessive power on 11 meters and ruining the band for your fellow CBers.

A. Jarry

4380. Re: Needed 2510 Doctor

Newsgroup: rec.radio.cb
Date: 2000-06-02 00:00:00 UTC
From: Scooter <Scooter@skipland.zzn.com>
Message-ID: <bBWZ4.273$EU3.2088@newsfeed.slurp.net>
Source record: 38153

I've had lots of time working with Lincoln/2510/2600/TS-5010 etc. They are very touchy radios, but when tuned yield great results. Like someone else stated it sounds as if it was "tweaked and tuned". That's probably why it was parted with. I'm sure once it's back to working condition it'll be a real radio again. If you have the equipment I can e-mail you the alignment procedures. You'll at least need a scope, freq counter (not inline), and a signal generator will be helpful. It's possible that with the help of some friends you can tune the receive back in, but the transmit will be very hard to do without a scope. It's easy to get out of whack and pick up some weird sinewaves. Setting the TX freq can be done with an inline, but you will still be off in the oscillator sections. I spent tons of time working with these that I try to limit my intake to radios of this nature as these are now what I specialize in.

4382. Is the Radio Shack TR-446 a Uniden CB?

Newsgroup: rec.radio.cb
Date: 2000-06-02 00:00:00 UTC
From: OctaQuad <bly213@att.net>
Message-ID: <8h9f80fbu1@nnrp1.deja.com>
Source record: 38155

I was wondering if the Radio Shack TR-446 CB radio was made by Uniden
or not. If so what is the equivalent Uniden model of the TR-446.
I see the TR-446 go on sale at times at the local Radio Shack stores
and figure I might pick one up if it is a good Uniden AM rig under the
covers.

<<This above also is not followed by MANY>>

Tnom,

By stating that the 1.5 KW limit is "not followed by many" (hams), you have stated, in effect, that the majority of hams exceed the 1.5 KW limit.

Perhaps you spoke in error. Perhaps what you meant to say was that a few of your local ham/cbers bragged to you once about running high power and you took this as proof that the majority of hams are as obsessed with obtaining illegal RF output as you and your acquaintances are.

A. Jarry

4384. Re: Dave made question still UNanswered !!!

Source record: 38157

That's not an easy issue. A lot depends on the ambient channel noise. A high channel noise will have a tendancy to make a high swinging signal much less readable. A heavy carrier will blot out background channel noise and improve readability. However, if the channel is relatively quiet... the swinging signal with it's higher level of modulaion may be more of an attention getter. It's best to be able to have access to both for maximum flexibility.

Source record: 38160

The trc-446 is made by MAXON & is essentially a Maxon MCB-100WXD with cosmetic differences. The internal board design is NOTHING like any Uniden , Cobra or Ranger CB radio. These models are well built, but don't "peak up" well & aren't able to "do" xtra channels. A Uniden 76/78 or Cobra 29 is a much better radio.....

>stated, in effect, that the majority of hams exceed the 1.5 KW limit.

You need to explain how Many equals Majority? Where do you get your
logic?

Definitions.....

Many: consisting of large numbers

Majority: quantity of more than one half

It seems to me if there are 700,000 hams the a majority would be
between 350,001 and 699,999

And many could be anything between 100 and 349,999

>Perhaps you spoke in error. Perhaps what you meant to say was that a few of
>your local ham/cbers bragged to you once about running high power and you took
>this as proof that the majority of hams are as obsessed with obtaining illegal
>RF output as you and your acquaintances are.
>
>A. Jarry

I have no regrets about what I said. It was, and is accurate. What
is in question here is not what I said, but how some need to do a
better job at reading and comprehending what is being said. Also
what is in question here is why there is no acknowledgement
that a misinterpretation was made.

Could it be that a "Low Life CB'er type" like tnom can comprehend
messages better than a "High Fallootin Paper Wavin"amatuer?

Could this be to hard to stomach? Is this why there is no admittance
of an error being made?

PS I do not dislike hams. I only dislike arrogant, holier than thou,
stuck up, think they know it alls.

No I did not. For you to assume that from what I said would mean
that the sample of amateurs that I know are a accurate statistical
representation of the whole group. I never said they were. How
could anyone ever deem it so when there are 7000,000 amateurs,
and I only know a few?

Again what I said was "most of the amateurs I know" and" many
amateurs" run illegal.

I never said most amateurs run illegal. Why can't you just admit it?

Jason, there actually is a number of various uses in research, one is Royal Rife technology for NON-APPROVED medical treatment, its been awhile since i've seen the various uses, perhaps others out here have more knowledge of it! I do know a number of large RF amplifiers are used in various pieces of professional medical equipment... A friend buys quite a few 8877 medical pulls every year....

Yes he is a Ham and you should see The "ROBUST" amp he is building with 4 8877's, and a custom Dahl Transformer!

I have wasted a lot of money on Radio Shack antennas. The first was a cell phone look a like. I paid like 40 bucks or so for it. A handheld CB got out further. Then like a dummy I went back to Radio Shack and bought a plain looking one for about 40 bucks. It was a little better but not much. Then I got a cobra that outperformed them both. I sold the cobra and got me a wilson 1000. So far that has been the best magnet mount antenna I have had. I have used a "102" whip on old beat up cars. Those antennas are the best I think. But now I own newer nice looking cars and puting holes in them for an antenna just to talk is out of the question. So I still use the wilson. I also have the whip put away for the next cheap car. As for the Radio Shack Junk I gave the cell phone looking one away. As for the other I use it for a fishing pole.It works great sticking it to the bumber while I grab a snack out of the cooler.

Jason,
For one, how about a MRI (magnetic resonance imaging).
Cat scans are another. They used to use a lot of 8877's,
changed after a set number of hours no matter the condition
of the tube, great source for 'pull-outs'.

>This inverted impedance is your new impedance. Period.
>You do not then take this new impedance and somehow say
>it goes in series with the old impedance for a cancelling
>effect. It doesn't work that way.

I still haven't been able to better reply, but I do have a quote
that does substantiate the presence of the phenomenon. It
does not however explain what factors create the greater
bandwidth. That explanation was theorized by myself and I
still believe it to be accurate.
****
"The feed point resistance or a resonant quarter wave rear-mounted
whip is approximately 20 to 25 Ohms. While the standing-wave ratio
when using 50-ohm coaxial line will not be much greater than 2 to 1,
it is nevertheless desirable to make the line to the transmitter
exactly one quarter wavelength long electrically at the center of the
band. This procedure will minimize variations in loading over the
band. The physical length of RG-8/U cable, from antenna base to
antenna coupling coil, should be approximately 5 feet 6 inches."
****
That is a quote from the Radio Handbook, 1956, by William Orr
Chapter 23, Mobil Equipment and Installations, Section 9
Mobil Antennas, Page 468

It should be noted that 5 feet 6 inches is 1/4 wavelength which is
the same electrically as 3/4 wavelength, or 16 feet 6 inches at 10
meters. Do you doubt William Orr? Do you think that 18 feet at
11 meters is just a random practical length? It is true that any
length will work, but the phenomenon above is one reason that
some mobile antenna manufactures recommend 18 feet of 66%
velocity factor coax.

4412. Re: Is the Radio Shack TR-446 a Uniden CB?

Newsgroup: rec.radio.cb
Date: 2000-06-02 00:00:00 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <39387042$1@news.planetc.com>
Source record: 38185

Very simple to see. IF it is made in the Phillipines, it is probably a Uniden. If not, then not. I have to look in my notes to see IF it is similar to Uniden, which aren't in front of me now. E mail me & ask & I'll look in the AM. The main reason as to WHY to NOT buy Rat Shack CB's is that they are overpriced made in China, for the most part. IF you got questions, they DON'T have answers. We do here!!!
Dave!

OctaQuad wrote in message <8h9f80fbu1@nnrp1.deja.com>...
I was wondering if the Radio Shack TR-446 CB radio was made by Uniden or not. If so what is the equivalent Uniden model of the TR-446.
I see the TR-446 go on sale at times at the local Radio Shack stores and figure I might pick one up if it is a good Uniden AM rig under the covers.

The amplifer would probably sound best around 1.5-2 watts into it.. it
gives the Amp a little headroom....

KRS,
Look at the specs' again. Depending on the type of
amplifier your building (grounded grid, screen fed, grid fed),
'A', 'B', 'AB1', 'AB2', 'C', etc, you could choose either
of these two tubes. What are you going to do with the amplifier?
Just not enough information to make a choice...
'Doc

>together?

Hey Dave,

He was using an old time CB-ism. I first heard the term back in
the very early 1970s. The CBers referred to a direction antenna
as "a set of beams" instead of a "beam".

Actually, "cophased" is another CB-ism. The correct term is
simply "phased".

Hi Gary,

: Gary Danaher <gdanaher@home.com> wrote:
: I had a little extra time this morning so in response the the assertion
: that most amateurs are operating in excess of legal power.

Not most, but a lot do... Been on the HF Bands as of late... say 80, 40 and 20 meters... even 15 for that matter.

: I went to the
: Henry Radio web site and did a little checking. They sell amps for many
: purposes, but yes, they could be used on the amateur frequencies as well
: as CB.

Not without the purchase of an Export Model that would require you telling them your callsign to prove your a ham... I don't think you can buy an Export Model without some questions first. If you'd made a serious effort to get a ham ticket, your probably gonna want to run the gear right.

: Quick, get your check book out so you can order one of these and
: become the channel master. The 2KD Classic is rated at 1.2 KW and sells
: for a mere $1895. Their other amps rated at the legal amateur limit of
: 1.5 KW are priced from $2795 to $4595. Amps rated at 2 KW PEP to 5 KW
: PEP sell in a range from $2695 to $6900.

No, these amps are considered legal limit class amplifiers. Most of the ham channel masters (we call them "net controls") use tubes with handles, often made by Eimac and similar Companies. "Any time you think you have a lot of power, remember... there's always someone with a lot more on the band." skipper's rule

: If you are doing scientific or
: medical research, these are the Cadillacs to buy.

I do both, we don't consider them the Cadillacs... just nice to have and use for certain applications.

: If you are an amateur
: and operate on some sort of a budget, a thousand dollar Ameritron looks
: more tempting. Since there are somewhere around 700,000 licensed
: amateurs in the USA, and since Tnom was asserting that most of them ran
: excessive power, that would mean that the only manufacturer of commonly
: available linear amplifiers capable of producing PEP in excess of 1500
: watts should have produced more than 350,000 of these.

Ameritron makes some really quirky amplifiers... some nice ones, but also some quirky ones. I enjoy the neutralized 811a amplifiers... None of my

811a amps require neutralizing... nor other triodes of similar design.

: Now, go over to
: eBay and search for Henry Radio and see how many of them are up for sale
: at any given time. Truth is, Henry builds a very good amplifier, but few
: are sold to amateurs.

Henry amplifers of certain types and models have problems that should be corrected. You can review some of these problems at http://www.vcnet.com/~measures if you'd like to do your homework.

: Some are sold to the amateurs with deep pockets,
: but the majority of their product goes to the
: scientific-education-medical community. If I operate from this location
: at 1500 watts, the listener at the other end can't tell the difference
: between 1200 watts and 2500 watts.

I could, you'd be about double the power or 3dB... Most s-meters are calibrated as 6 dB per s-unit... I can see my meter move slight amounts, it's an analog type.

: I would need to increase my power to
: 3 kw for the listener to discern any difference, measured by an S unit
: on his meter. Henry's 5K Classic produces 3500 watts PEP for $4696.
: Tnom, just how many hams do you know are willing to spend $4695 for one
: S-unit??

A lot... There are news groups and list servers full of them talking mostly about amplifiers. Check out http://www.contesting.com for the one such group.

: Now that you know the truth, call Henry Radio at 1.800.877.7979 and
: place your order. The operators are on the edge of their seats awaiting
: your call. Just remember, the legal output for CB is 4 watts AM and 12
: watts SSB.

I'd rather build and repair my own thank you... You can find some examples at http://sonic.ucdavis.edu in the amateur radio pages.

The legal output for CB is 4 watts AM, 12 watts PEP for SSB. I'd rather have a radio operator run a clean station first. I've got one lid ham across town splattering +- 50KHz on 40 meters SSB and a cb'er down the block with at least 100 watts output and semi decent AM bandwidth +- 12KHz... I can see it on a spectrum analyzer as a pretty clean signal. I'm glad the ham lives across town, but I wish he'd fix his rig.

cheers

Tnom's original post stated that most amateurs ran power above the legal limit. I would like for him to indicate where that number came from, but of course he can't produce it because the figure is false. This is way off topic, but it gets back to some CBers insisting that it is alright for them to run megawatts because everyone else does--sort of like asking your 12 year old if Johnny jumped off the roof, would you do it too, and getting a positive response. There is just too much spectrum available to amateurs for them to worry about being the 'channel master'. Even the so called net controllers usually use no more than barefoot power, because they are talking to guys with the same and no amps. It does them no good to be hear s9 in Milwaukee if the guy in Milwaukee can't be heard at all in Miami. It requires 2-way communication. It is frequently the case that 100 watts won't make the trip. Great example of this is the recent dxpedition in Bhutan. A52A operated with the local limit not to exceed 120 watts, and they were barely heard here, but yep, I did work them. They were sitting up against a mountain some 11000 miles away, and we had two way contacts, so it CAN be done. A kilowatt would have brought them up out of the mud more often, but if the propagation isn't favourable to your location, no amount of power will get their signal to you.

To get extra ch's in the Magnum Delta Force, turn radio on, press and hold the function button. While holding it in, push the call button. Now let both buttons go. A band letter will show up. You can change the bands using the call button. BTW, does your DF have a lot of modulation? Mine does. It over modulates.

Learn to read. I said speaking of 1500 watts,"This above also is not
followed by many"

I also said speaking of amateurs, "In addition most that I know ignore
the 1500 watt limit also."

I stand by those statements.

There are several reading comprehension courses available for you
at the junior college.

I have no time to properly reply to your post. Give me some
to digest and respond better.

What you have done seems flawed from the standpoint of
representing what I have said.

I have two variables in my theory. It appears you only use one.
You use different line lengths that can represent a frequency sweep.
You use these different lengths and calculate a new impedance,
but you continue to use the original antenna.
The other variable you don't seem to calculate. Namely a new
impedance of the antenna itself as it gets frequency sweped.

The crux of my theory depends on two variables interacting with
each other. Either positively or negatively. Explained below.

When the antennas resistance at resonance is less than the
characteristic impedance of the coax, this being the normal
case, and if we move off the resonant frequency we find
this.
Because of the inverting action of a quarter wave
matching section, the added inductive reactance at the
antenna, when you go higher in frequency, is partially
canceled by the added capacitive reactance, that
comes from the former quarter wave section, that is now
more than a quarter wave matching section.
The same inverting action takes place if you go lower
in frequency. In this case the added capacitive reactance
at the antenna, is partially canceled by the added inductive
reactance of the now less than quarter wave matching
section.

Although I have never ran numbers on this I have made up
1/2 wave and 3/4 wave cables and the theory seems to
hold true.

The Grants do not need a power mic at all. I have two GrantXL's and they swing from 2W to 25W with modulation up to 110%. These are loud radios. I also had another GrantXL, this one I did have a D104 hooked up to it. The radio would get really hot. I asked about this and was told that the radio didn't need a power mic.

gary , i don't know how many hams are willing to buy henrys but the
other day they had a henry 8k on ebay, and the guy that bought it
wasn't a ham, i would be willing to bet on it, and that amp brought in
the neighborhood of $6,000 or so, if i am not mistaken. it was real
nice, but a little too rich for my blood. my neighbors don't want me to
buy it nor does uncle charlie, but it would have been a good piece of
hobby room furniture though, albeit, somewhat expensive. it does seem
though that these henrys do retain their value and are much sought
after, ...cd is out.............

I also agree. I have a 1/2 wl dipole feed with 50 ohm cable SWR is about 1.5:1 just as you would expect. Tried lengthing the coax in one foot increments adding as much as 9ft. This had no effect on SWR reading. I then diconnected the side of the dipole that was connected to the sheild and SWR went up to over 3:1. I was able to make the SWR read 1.8:1 then by changing the coax length. So if you can appreciable effect the SWR reading by changing the coax length something is FUBAR.

Yep, 6 grand was a deal for that one, too, if it was near new. They list new for $6900 and can be bought from a dealer for a few hundred less. Remember though that that amp might find the inside of a cancer research facility or something similar. As you said, it probably wasn't a ham. There is now a 4K ultra for sale that was originally with the Dept. of State. It likely won't go to a ham either at the price being asked.

4473. What's a good mobile antenna for a small Honda Civic?

Newsgroup: rec.radio.cb
Date: 2000-06-02 00:00:00 UTC
From: OctaQuad <bly213@att.net>
Message-ID: <8h9din$e4d$1@nnrp1.deja.com>
Source record: 38246

Well, since I am thinking about setting up a mobile rig, I might as
well start researching into what mobile Antenna is recommended to use
on a small car such as the Honda Civic. I know that small cars do not
get as strong of a signal out as a larger car (read ground plane) would.

But who out there has any experience with this.

I should mention I don't want to look rediculous with a huge
montrousity of an antenna hanging off of the roof or trunk of my car.
The less attention it attracts the better. Stealth is best, but that
has an inverse relationship with signal strength. Arrgghhhh!

Oh well let me hear from you CB car antenna experts on what you think
will work best. A magnet mount antenna from Radio Shack (since they
are so convient and I can run right down to get one) or stick with the
main brand names like Whistler, K40, etc.? I think those Radio Shack
magnet mounts will perform just as good as the other brands most likely.
(Please no flaming RS now...)

Out.

What grade are you in? How is "most that I know" the same as
your quote below?

"Since there are somewhere around 700,000 licensed amateurs in the
USA, and since Tnom was asserting that most of them ran excessive
power."

So you are assuming that I know 700,000 amateurs? What grade are you
in?

Heliax? Rigid Coax? Hardline?

Jeeeeeeez... talk about overkill!! Unless he's running 10kW, anything more expensive than Belden 9913 would be a waste of money. RG8 (90% shield) or RG 213 should suffice for most 27 Mhz applications... the difference between hard-line and 9913 would indistinguishable to the the person receiving his signal.

If you inferred that from my post then I apologise - that was not my
intention. Rather, it was to set the record straight..

Please follow me through this. Let's be sure we have right model.
The T490 series is labelled MINIPHONE on the front panel and uses a
"pushbutton-thumbwheel" for channel select. The T490's came with the
module I described, which presents 16 bits of info in parallel to the
synthesiser chip. The module sits atop a pair of rows of molex pins
in a T formation on the lower (non-hinged) board.

There is nothing stopping a person with determination (and preferably
one channel) from setting up the required data via a diode array.
Maybe that is what has happened to yours.

The T500 ("plastic fantastic" - before the yacht) was a two-channel
plastic clamshell case with two pushbuttons on the front F1 and F2 to
select from the two channels. These used diode matrices for data.
early units used leaded components, later I saw use of SMT diodes.
Solder bridges were used to select 1 or 0 for each diode (bit).

Can you confirm which radio you have and we can possibly help you some
more.

Peter

4477. List of the rec.radio newsgroups

Newsgroup: rec.radio.cb
Date: 2000-06-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8h7j2v$m4k$1@news.hawaii.edu>
Source record: 38250
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any amateur topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O

>

Thank you, I'm Cetainly glad my Extra Class ticket has not made me run
around and whine about things i cannot change!

> *You can't seem to comprehend that, even though they are licensed to run
ten
> times more, the majority of hams typically use 100 watts.
>

Typically NO, some YES, Typically the fellows i litsten to run what
they have, no i'm not referring to contesters or folks running around
looking for a QSO, I'm referring to the regulars who are on the radio most
every day on the same frequency. These fellows will give each other signal
reports of 40+ over 9 and quietly brag about there output levels, and quite
obviously need nothing near the power they are using.

> *You assume that DXers who "sound" loud in a pileup MUST be using illegal
> amounts of RF power.

Here again, your assumptions are incorrect, Can you tell a station
running 3-500z's? I can, and be correct 7 of 10 times. it is not that
difficult to pick out the ones running power! GEE, California Even has some
nicknames regarding output! And no i have no proof.. You just tell me
that the Export alpha 77 with the pair of 8877's sitting on Joe ham's table
is there just to be "ROBUST" Get real he did not pay $7,000.00 so he could
have a robust amplifier!!

>
> *You don't understand that in the mind of the average ham, risking their
> license, running up their electric bill, and stressing their expensive

> amplifier tubes in order to gain one or two S-Units over S-9 is a
thoroughly
> ridiculous concept.
>

Again some, maybe even the majority, BUT NOT ALL! Risk of license
loss, yep definately, Electric Bill?? LOL, sure he paid 3-7k for his amp
and he is worried about a few bucks??? Stressing???? Are you that out of
touch??? Some of the amps today will LOAF ALONG at 4KW PEP OUT.... Oh, i
will agree with you on the Smeter! However QUITE A NUMBER OF THOSE HAMS
STARTED IN CB and probably retain some of that CB-mentality you mentioned!
Lord knows a TRUE HAM would NEVER break a rule, or law!!

> * You assume that the object in ham radio is the same as in CB: i.e.; to
be the
> loudest and cover up everyone else.

I think your the one ASSUMING! did i ever say ALL HAMS??? or EVEN
MOST?????? You sir, assume I'm some 20 year old kid riding in my mobile
with a 250 Texas Star talking on 19! You also assume that most CBers Have
what you call a CB mentality! Why don't you define CB mentality?? What
happens with that CB mentality when it goes HAM??? I can jump on my local
repeaters and talk with 10 or 15 fellow hams all of whom i talked to 25
years ago on 11 meters before they were HAMS. The funny thing is any one of
them could be considered assets to the local radio community, Yet they
retain a bit of CB mentality!

>
> * You can't grasp the operational advantages of running a robustly
designed
> (legal limit plus) amplifier well below its limits.

Gee, if you say so!

>
> On the whole, I find your arguments specious and your logic flawed. The
> existence of "bad apples" in the ham barrel is a very poor excuse indeed
for
> running excessive power on 11 meters and ruining the band for your fellow
> CBers.
>
> A. Jarry

You've never seen me say get a bigger amp, you've never seen me
endorse use of amplifiers on 11 meters. What makes you think I run an
amplifier on 11?? You just Haven't seen me Complain, correct, or point out
the illegal use. You have seen me post remarks about folks that make rude
remarks, act like they no it all, and think that because they have a Ham
license that they are better than all the folks with "CBer Mentality"
Believe it or not, not all cbers are low iq, overmodulated, overdriven,
trouble causers. Some are just normal folks trying to enjoy the hobby.
Yeah even some of those Run Amplifiers.

As a closing statement i will say that i realize i'm
fighting a losing battle trying to defend CB and CBers... Typically The
average Ham looks down upon a cber, and certainly thinks they are somehow
superior....

Stick with a Cobra or Uniden, but don't get the soundtracker. A Wilson 500 magnetic mount is a great little antenna. I would go with Cobra 25 LTD myself. I like the Unidens, but I had a compact Uniden and they don't have enough filters. Traveling long distance I might even spend a little extra money and get the Cobra 25 LTD with the weather bands. I have ran into some storms myself traveling and the weather bands are nice to have, especially late at night when nobody is talking on the CB. Good luck.

My first recommendation would be just a plain old Cobra 29-LTD Classic (not the new sound trackers). For antennas I have always been partial to either the 102" whip (which works great on trucks and jeeps) or a Wilson 1000 roof mount which I presently run on my pickup. I used to have a Radio Shack 102" stainless steel whip on my pickup and I actually think it is better. Shakespeare make a great whip also, but you would probably have to order it. If you go with a 102" or 96" whip make sure that you buy the big spring for it at Radio Shack. I have bought spings for whips at truck stops and other places and your 102" whip will flop all over the place and bang the hell out of your vehicle. Save yourself some misery and buy the spring from Radio Shack. On your off road vehicle if you plan on putting some distance between you and your buddies you might want to consider a SSB radio as well, you can reach a little further with the side band (SSB). Good luck.

The really cheap radios will get on your nerves because they're so noisy. The best working radio for the least money is the uniden PC66 or PC68. Used they should be around $30-60.
Antenna should be a "Lil' Wil" for 3-5mi range $30, Wilson 500 will get you better range for $60, both are magnetic.

4490. Antron 99 Forsale

4493. Does Uiniden Grant LT need a power mic?

Newsgroup: rec.radio.cb
Date: 2000-06-02 00:00:00 UTC
From: bly213@att.net
Message-ID: <8h8f1t$m3t$1@nnrp1.deja.com>
Source record: 38266

I thought I had read a few posts while researching on the Uniden Grant XL and Grant LT CB radios that said "...you don't need to use a power microphone with the radio... because it has such a strong audio modulation circuit built in that can be peaked out...". It was not said exactly in those words, but the kist was the same.

Any opinions or comments from folks using the GRANT LT radio?
I ordered a Astatic D104MB6 mic by the way. Hope I did not waste my money on a power mic for no reason. I guess I could always use the mic on some other rig.

Also what are the differences between a D104MB6 mic and a D104MB6G or something like that. I've seen dealers listing two models with one extra letter suffixed to the main model number of D104MB6.

My main goal getting a new mobile CB was to have real nice loud, clear and high quality sudio without overmodulating and splashing. It is always a pleasure to listen to other CB stations with excellent clear and loud (but not excessive) audio. Home these Uniden Grant LT units are capable of this.

Will a ham IV rotor turn a set of 8 element horizontal beams?

4495. Re: Grant LT or Grant XL What is the Difference?

Newsgroup: rec.radio.cb
Date: 2000-06-02 00:00:00 UTC
From: bly213@att.net
Message-ID: <8h8fjimib1@nnrp1.deja.com>
Source record: 38268

Jumping back into the CB scene for a mobile rig, I see Cobra has Sound Tracker and Uniden has Dynamic Squelch Control. Are these two features one and the same thing or are they different? I know everyone says that they are the same chassis.

What are the current and latest opinions comparing the new Grant LT with the older Grant XL? Would appreciate honest knowlegable facts on why one is better or worse or same as the other. Just don't come back and say "the LT is better" or "I prefer the XL". Please state why.

I just ordered the Grant LT with ($30 rebate) hoping that it is at least the equivalent of the older Grant XL and hoping that the new gimmick they call "Dynamic Squelch Control" does not degrade nor hinder anything in the way of receive and transmit audio modulation quality. If it does interfere, can it be totally diabled so that the radio becomes an XL?

I've read some old forum posts on these radios but nothing ever so conclusive as to whether the GRANT LT was worth getting over the XL. Bring on the facts please on this Grant LT radio if you have already taken this route and know from experience. If you bought the GRANT LT did you have any regrets or are you happy?

I personally like the extra's offered on the LT like the backlighting and front mounted mic connection... and possible a quieter and better receiver section because of the DSC feature.

Thanks to all for any comments and info.

Bill Back Quiet!

OK, what am I to listen FOR? In 37 years on the air, I have spent thousands of hours on the air, and with the exception of one station in Spain, I can honestly say that I have never heard anyone SOUND or VERBALLY DISCLOSE they were operating with excessive power. You are saying that Jerry is assuming too much, but then perhaps you are as well. Propagation does weird things to signals. I have talked to a guy in Diego Garcia-and there is only one ham shack there for all to use- and had loud arm chair copy. Then again, I've listened to that same signal over an hour or so dwindle to nothing. That's how it works, and that unfortunately is your misconception. Just because a station may sound loud to you at the moment does not mean that he is running kilowatts of power. It just isn't so, and for you to argue otherwise merely notes your own ignorance of the subject.

There are so many because there a a few good CB techs out here that work on them AND know that the newer ones are even WORSE because they are MADE in CHINA! The RULE for ALL electronics and other realms is that IF it is made in China, DO NOT buy it. Quality is less because it is made by COMMUNIST SLAVES that don't care because there is NO incentive to work, since everyone gets paid the same, except their unlawful government, which makes MOST of the money so they can threaten US & LA ! The"sound tracker" circuits have been rated as SCAMS (Scam tracker) by CB techs much better than myself here and even the average truck driver KNOWS that IT DOES NOTHING. IT IS a SCAM. COBRA is LIARS!!!!!
Dave!!!!! (buy Uniden--Grant is same basic CB made where they use to make the 148's--better made & quality).

Thanks for the info. I am not interested in alleged "40 watt signals."
Forget the peak or peak to peak meter readings--these are for scam artists
that want to impress their customers with BIG numbers. My Bird meter (AM,
average power) says 6 or so watts, not 40 when whistling into it. You big
number hype people don't impress no one but yourself. I instruct your
customers on what they are REALLY doing---use an AM power meter when
measuring AM power, not a SSB power meter!!!! By the way, 10 watts max
dead key into a HI-DRIVE, NOT 15 watts dead key. How many have you blown?
Dave!!!!!!!

Brad wrote in message <017djskoene51l42ivej032j43mtrmfr05@4ax.com>...
Dave made allows 5 watts. Which means you can put in a 5watts Dead key (No
modulation) signal and it will work. Ideally though you can run a 40 watt
signal into as well as long as you have a 2.5 to 5 watt dead key with the
rest
of the 40 watt swing (when audio is applied). this works on the Low drives
and the High drive amps which are (5 watts lo drive and 15 watts high
drive).
rule of thumb is to set your power below what the amp requires as max and
then
Swing the rest and you will not hurt them as long as the signal is clean and
not over modulated.

Rocket Scientist:

NO, do not recommend ANY Cobras. They are made in RED CHINA and are cheapened up Unidens. Bobby: Get a Uniden PC-66 or 68, or if you want lower cost, get a Pro-510. Any 3' American made magnet mount will do, or longer. Don't get 2'. I've been doing this almost 21 years on my own, and specialize in getting people the lowest cost equipment for the least amount of $$$$. Quality equipment. NO red china junk or stuff that is KNOWN to break down. E mail me with any other questions.
Dave!!!!!

Rocketman wrote in message <3937A4AF.27A6D82A@swbell.net>...
Stick with a Cobra or Uniden, but don't get the soundtracker. A Wilson 500 magnetic mount is a great little antenna. I would go with Cobra 25 LTD myself. I like the Unidens, but I had a compact Uniden and they don't have enough filters. Traveling long distance I might even spend a little extra money and get the Cobra 25 LTD with the weather bands. I have ran into some storms myself traveling and the weather bands are nice to have, especially late at night when nobody is talking on the CB. Good luck.

I had a little extra time this morning so in response the the assertion that most amateurs are operating in excess of legal power, I went to the Henry Radio web site and did a little checking. They sell amps for many purposes, but yes, they could be used on the amateur frequencies as well as CB. Quick, get your check book out so you can order one of these and become the channel master. The 2KD Classic is rated at 1.2 KW and sells for a mere $1895. Their other amps rated at the legal amateur limit of 1.5 KW are priced from $2795 to $4595. Amps rated at 2 KW PEP to 5 KW PEP sell in a range from $2695 to $6900. If you are doing scientific or medical research, these are the Cadillacs to buy. If you are an amateur and operate on some sort of a budget, a thousand dollar Ameritron looks more tempting. Since there are somewhere around 700,000 licensed amateurs in the USA, and since Tnom was asserting that most of them ran excessive power, that would mean that the only manufacturer of commonly available linear amplifiers capable of producing PEP in excess of 1500 watts should have produced more than 350,000 of these. Now, go over to eBay and search for Henry Radio and see how many of them are up for sale at any given time. Truth is, Henry builds a very good amplifier, but few are sold to amateurs. Some are sold to the amateurs with deep pockets, but the majority of their product goes to the scientific-education-medical community. If I operate from this location at 1500 watts, the listener at the other end can't tell the difference between 1200 watts and 2500 watts. I would need to increase my power to 3 kw for the listener to discern any difference, measured by an S unit on his meter. Henry's 5K Classic produces 3500 watts PEP for $4696. Tnom, just how many hams do you know are willing to spend $4695 for one S-unit??

Now that you know the truth, call Henry Radio at 1.800.877.7979 and place your order. The operators are on the edge of their seats awaiting your call. Just remember, the legal output for CB is 4 watts AM and 12 watts SSB.

Not really, Hill William. I'm probably in the top 20% or so. But I'd have to be rated by the top 5% to count, which definately won't be you, sunny!!! One of my customers said that his bro said that I was 1 of the top 3 in the land! I doubt it, but I'm still going in that direction, instead of LYING my way to the opposite end, which means I would be getting worse! Just the fact that I DO NOT put in Mod. kits puts me in at least the top 30%, right? Would I be any good IF I sold ANY CB's (new ones) made in RED COMMY China? I doubt it!!!! After almost 21 years doing this constant, I better be good, Thank The Lord!!!!!! He did it & not me myself!!!!
Dave!!!!!

Cross-posted to:
fr.rec.radio.amateur,aus.radio.amateur.misc,uk.radio.amateur,rec.radio.cb,rec.radio.amateur.misc,nl.radio.amateur

The t496 has a board mounted on a t shape connection. To see the diodes i had to lift the board off the connection and turn it over. The diodes are marked from N0 to N9, A0 to A5 and there is two banks of them seperated by the t connection in the middle of the board.
Recently i was faced with the problem of programming a t500 with a diode matrex 2 channel setup. That one was easy because i had the info and program that showed me how to set up the diodes. The costomer went away with a smile. In and out in 1 hour. Love it when a plan comes together.
I have seen a t496 with a eprom setup for 99 channels but mine has only a 10 channel selecter. (one thumb wheel) I would like another thumb wheel as well.
Thank you Chris for your comment. Yes you are right, i should look into at least attemping to alter freqs through trial and error. The only problem with this is i don't own a freq counter that goes that high. I will however do as you suggest if and when i have to or can do.
Thank you jeffrey for your comment. I will attempt to see if the supplier will come to the party with a info sheet.

Of course i would like a state of the art radio for use on ham bands. Unfortunatly being a luxury, radios are not part of the budget. If i told my missus how much i spent on my hobby so far she would have a kitten. I have been very good and repaired most of what i have at a very low cost. Partners will never understand. There are still a lot of good radios out there that are maybe old but still very good for the purposes i need them for.

cheers Mike vk4vzk

Tnom,

Perhaps what you intended to say was "not very many hams exceed the 1.5 KW PEP limit".

Unfortunately a number of people (including I) were confused by your sentence (above), which effectively indicates the exact opposite.

Can anyone out there tell me anything about my old Radio Shack TRC-430 mobile CB rig. I just ug it out of my garage. Used to have it installed in my FORD SHO car back about 9 years ago. So I guess it is about 10 years old. It is a nice slim little compact 40 channel unit with led S/RF meter, ANL switch, channel 9 switch, squelch and volumn control.

What I want to know is if it can be peaked out or modified for better audio modulation levels. It is all stock and has the original stock mike. I kept it in excellent condition. Thinking of sticking it back into my car for road trips, since it is so small and compact.

I have a Uniden GRANT LT on order but that is way too big to stick in my car I think.

Any info on this Radio Shack TRC-430 would be much appreciated. Schematics for it would be better!

no i doubt thats what he meant to say because more than just a few do. 20 and 80 meters are where the majority of the over powered hams are and most of them are contesters. the crowd on 14.295 from the west coast are running more than 1.5kw and even riley knows it. there not the only ones either. dont think the contesters actually keep there alphas and henrys at 1.5 instead of 2.5 or higher like there made to do when they are trying to have every possible advantage over the next guy

Tnom:
You make broad sweeping statements such as 'most of the hams I know...',
'many hams...' . To the casual reader, one might think that you are
right-that many hams do illegal things. It's sounding more like jealousy
than ignorance. I don't know where you live and who your circle of
friends might include. Perhaps they are fine and upstanding, and perhaps
they aren't. Nonetheless, generalizing that most amateurs do something
because most of your firends do it fails the logic test.

It's a whole lot easier for a CBer to run illegal power than it is for an amateur to run illegal power, just because of the numbers, and the electronic outcome at the other end is much more substantial when a CBer is illegal compared to an amateur. Tnom had generalized from his group of acquantances that most amateurs ran excessive power. Now I hear that the contesters are running illegal power. Unless you are in the guys driveway with a field strength meter or in the shack looking at the watt meter, you have no way of knowing what power levels are actually produced--and the field strength meter might not be a good indication of this anyway. I dare anyone to listen to two stations on the other side of the country, perhaps with different antenna systems, and tell if one is emitting 1000 watts or 1500 watts. It just isn't that easy to detect. Furthermore, another thousand watts is only going to budge the s meter a tad and again dependent upon propogation and antenna, you still might not hear a difference.

I for one have never said that most CBers run illegal power. I don't believe that to be the case. I operate 11 meters with legal power. I will say though that from the postings, most contributors to this newsgroup claim to operate illegal power. It is the MAIN topic of discussion. After all, an amp of any king attached to the output of a CB is illegal, so even something pumping out 50 watts is illegal, but hopefully less disruptive than those bolted to pickup truck beds.

It's not the greatest radio of all time but isn't bad either. Sort of a Chevy of radios? If it is working well, blow the dust out of it and use it. It might need some adjustment after sitting all this time, but be aware that the bench time for repair work might be greater than it is worth. Consider a new radio of better quality if your intent is to use it regularly.

No. There is no cancelling effect. That was one of my points.
There is no added capacitive (or inductive) reactance.
A quarter wave section does invert the impedance: capacitive
becomes inductive and inductive becomes capacitive.
This inverted impedance is your new impedance. Period.
You do not then take this new impedance and somehow say
it goes in series with the old impedance for a cancelling
effect. It doesn't work that way.

Thanks for clearing that all up for us. Now, what is the basis in fact
for your assertion that many hams do illegal things? Please don't
respond with a 'many of my friends' kind of answer. Perhaps you could
please define what you mean by 'many' a la President Clinton.

just as you say tnom shouldnt judge hams by what his friends say, you shouldnt judge cb radio by whats on this group. this is in no way a reflection of cb. just as you say its hard to tell the power of hams its the same about cb, no way to know what a guy is putting out. when the dx is right i could hit you with 20 over 9 with a barefoot pc 122 and a small beam

<< 20 and 80 meters are where the majority of the over powered hams are and most of them are contesters the crowd on 14.295 from the west coast are running more than 1.5kw and even riley knows it. there not the only ones either. dont think the contesters actually keep there alphas and henrys at 1.5 instead of 2.5 or higher like there made to do when they are trying to have every possible advantage over the next guy>>

So you would like people to think there are significant numbers of hams running 2, 3 and 4 Kilowatts, all up and down the bands, and at all times of day and week, and poor Riley is impotent to stop them.

Sounds like a paranoid fantasy to me. Can you substantiate any of it, or is it just a handy excuse for you to justify illegal radio activity?

A. Jarry

what kind of glasses do you see the world thru that allows you to think hams are any different than normal people? does a ticket magically make a person better? do you also not see or hear the intentional jamming and times when people move 1 kc away and talk just to cause problem s for exsisting comms that happens frequently? dont think for a minute that because we are cb'ers we dont know or listen to what goes on in the hf ham bands or vhf and uhf for that matter. 10 is about the only band that doesnt have these problems and thats only when the cq contest isnt running. you trying to paint hams as all good guys following the rules fails the logic test as well, there just normal people who took two weeks out of there life to study a answer book and listen to code tapes. any fool can do that if they can stand putting up with you guys attitude of "were better that others because we have a lisence". i know i cant.

as soon as you show me the numbers of cb'ers running illegaly i'll show you the numbers on hams in contesting. do you honestly need a study to show it to you? if so then your not spending much time on the HF bands. take a look at the inside of some of these guys shacks. lots of web sites have pictures of there setups. wont find any amps running 811a's in a contester place.

ps thats should read tim in galveston county

no, just during contest weekends does it run rampit and if you deny it your blind to the situation or just covering up for your hobby. its really not up for debate, just ask some of your more expereinced ham friends that have been around and yes the guys on 14295 are there every evening running large power and if riley is worth at least 5 cents and hour he knows it too. i'm not justifying anything, i dont care what anybody does on your ham bands legal or other wise

HI

I had the same problem too, [i own a honda civic too]. i recomend a K40 antenna or the radio shack huge5" magnetic base then simply attach an antenna with the desried style [whip or fiberglass] and length. This works well and is not very noticable either and since it is Mag mount it can be removed and stored in the truck.

hope this helps

I will have to disagree with your way of checking the alt. You never want to take off the battery cable while the car is running. If the alt would put out a power surge, the battery would not take it in. Instead it would go to your electronic and possibly damage them. Also I would like to add. When you take off the battery cable your alt will have to work harder because their is no other power source. So if you have a small motor the alt will pull it down. I bet the parts stores likes you if you replace your alt because it pulls down the motor. I will agree with you as far as drawing more power the you can generate killing the motor. I dont think its the case here though. Just my two cents worth.

Never been asked for my call sign before buying an amplifier.
Never tried buying an 'export' model amplifier either. Why would
I want an 'export' model? To get 10 meters? Most amplifiers are
fairly easy to make operable on 10 meters.

> No, these amps are considered legal limit class amplifiers. Most of the
> ham channel masters (we call them "net controls") use tubes with handles,
> often made by Eimac and similar Companies.

Net control stations are 'Channel Masters'? I'll have to
tell one or two of them that, they probably don't know it. And
They all use tubes with 'handles'? Mercy! An 8877 has been the
largest I've heard on using. Most use 811's, 3-500z's, maybe
a few 572b's. Can you get those with handles?

> Ameritron makes some really quirky amplifiers... some nice ones, but also

Don't think I'd say a "lot". I'd certainly say there are
a few who would pay that kinda money, but not a 'lot'.

Source record: 38345

I think you may have mis-described it, the procedure is push function and hold call until it goes into expanded mode, you can also push function and then push call and it will go into channel display instead of frequency, just repeat the process to go back to freq display... I was told three versions exist.

1: Remove zero ohm surface mount Resistor, clip diode behind channel selector knob, reset CPU, push function, hold call.
2: Same as above except no zero ohm resistor to remove...

3: just push function and hold call.

The function/call step has to be done any time the radio is turned off or removed from power, it defaults to 10 meter mode. A diode can be added that will make it power up in the xpanded mode....

many other mods exist for this radio these are just frequency related.

Dave, are you that big of a Twit or what??? Doh! sure drive the hell out of the 2290, wich in turn drives the hell out of the 2879's, by all means don't bother giving the amp a little room to breath hell just run about 20 watts into it!! You call yourself a tech in the top 100??? LOL, i know CB Butchers with the proverbial golden screwdriver that have more sense then you do!! Another thing since when would a top CB tech need to ask "US IDIOTS" what to drive a Dave box with???? Hell if you were so good you would build your own!!

Your probably one of those guys who jacks up the output of a cb to 10 watts deadkey, swinging to 6, then you put your fancy DOSY meter on peak mode and tell the customers that it has plenty of forward swing!

Yeah, I used them a couple of years ago building an amp, actually doing some amp experiments. They work fine as long as you keep everything well balanced. If you don't the resistors get hot in a hurry. For the most part I tried the coaxial cable type using 70 ohm coax and 100 ohm resistors. Also experiment with a toroidal design that worked very well on the bench into dummy loads but I never used it for anything. It now has a second life as a 4:1 BALUN.

Mike
I guess you're lucky - of all the 10- and 100-channel units I've
seen and serviced over a decade or more, I haven't seen the diode
array on these.

Looking into my prog software for the 490's, I can tell you that:

N9=409.6 MHz
N8= 204.8 MHZ etc down to
N0= 800kHz
and
A5=400kHz down to
A0=12.5kHz

Which line is which I can't readily tell because I only see this as
EPROM data and the pinout info in the service manual is useless here.

I suggest you try and get data on the PLL chip - Motorola MC 145152.
that will tell you which line is which.

Some of the larger amps are considered Export, This may have changed but Alpha used to offer the two 77's SX/DX only difference is one used a pair of 8877's instead of a single... Henry's 8k ultra and some of the others are considered export. of course military or industrial also....

this is all out of hand!!! LOL, i forget what country it is but I was searching the web with one of the search engines and came acrossed an amp manufacturer, it may have been in Brazil, anyway this company made up to 25 kilowatt amps for the amateur market, however they DID have a disclaimer saying they could not ship to the US...

Like I told him. I measure my words. If I wanted to say:

Most amateurs then I would of said it. Instead I chose
to use: "most that I know" and "many"

Why would I use most if I meant "many"? and why would I
include "that i know"? Did I include "that I know" because
I had some spare words laying around that I needed to
dispose of?

You also should think about improving your comprehension.

The sound tracker can be disabled. If it is indeed malfunctioning with all on this group, send it back to cobra. It has a two year warranty.

I sell them all the time. When you purchase something that is too eliminate the noise then it will do just that. Be careful not to expect the noise gone but range the same.

Use an EQ to eliminate the undesirable noises that you are hearing without compromising the range.

Be sure if you have clipped and snipped to put it all back together before you send it to cobra.

I have never had problems tuning these radio's. I have had a few (not many compared to the amount sold that developed a receive chirp or have a choppy receive.) Prior to selling a unit I let the customer know about the problems encountered. The likelihood of them having the same problem and where to send it if it does. Cobra will take care of it.

The Uniden Dynamic Squelch Control is wonderful as well.

Generalizing again? What you meant to say perhaps is that YOU don't
understand me. Judging from your many incoherent posts, you don't seem
to understand much at all.

Never suggested that hams are any different from the general population.
In fact, I would suggest that for the most part, hams are pretty
representative of the general population, and the general population is
fairly accepting of laws and regulations and for the most part
compliant. In other words, there are more people outside of prison than
inside. To generalize that what you hear on a single frequency is
representative of all of a hobby is going way out on a limb to try to
prove a point. It is very apparent that you have no clue what you are
talking about here, and certainly don't have the years of experience it
might take to tell the difference.

Hi All,
I have a Uniden 28-30 that has been faulty for some time now and would like
to get it working again.
Symptoms are no Rx and Tx, display seems ok, band changing, scanning normal.
Audio occasionaly works on certain bands, FM background hash etc.
I suspect it could be the PLL or Microprocessor chip.
Any comments welcome.
Mark

Hello Tnom: The ARRL "Antenna Book" or the ARRL "Antenna Impedance Matching" book have great quality Smith Charts, for copying. I also believe the ARRL sells Smith Charts as a seperate item, but you might half to order them straight from the ARRL's web site.

The ARRL "Antenna Impedance Matching" book is worth its weight in gold. Its well written and shows how to match impedance, examples. A lot of highly technical books are very poorly written.

Jay, Rockin & Rollin in the Great Mojave Desert, just down the road ah ways from the fillin station.

YES, they are MAXON built radios. All Maxons are built in Korea or
Thailand, as you'll see if you look on the plate on the back of the radio.
Uniden hasn't built hardly any CB's for radioShack for quite a few years now.
Most are Maxon & other Chinese companies.

> antenna perform better on a home-made ground plane ?

Richard

I used one of these a couple of years ago, they work about as good as a
cheap 1/4 wave mobile works. Not great, but they do work. Good for
short range work. I would say a 102" whip made into a ground plane would
work much better. whenever you make an antenna one big coil to shorten its
length you get losses. Its interesting to note that before the military
went to
mostly satellite communication they used full length 1/4 wave whips almost
exclusively for short range stuff.

Jeff

well if the last 9 years of being a avid and daily swl'er isnt enough time to tell the current state of ham radio then i guess your right. just like most old hams you think you have to have at least 30 years under your belt to know anything. sorry it doesnt work that way. you generalize all cb'ers by what you read in this group so i'd say its ok tpo do the same with the guys on 14295

RadioShack carries the 102" whip? Ok, I definitly have one nearby, but I don't remember seeing one there. The only antennas I can remember is the overly expensive fiberglass one, the cellular lookalike one and the mag mount. Maybe it's something they don't keep out front!

Thanks. Also if anyone knows of any CB stores that would carry this and other goodies in the Baltimore area, I'm all ears.

Jeeperz

Why EXACTLY IYHO, is the Rain report an ongoing joke? Because it lends credibility to the fact that there are a slew of hams getting getting busted on a regular basis for violation of the rules? I thought you were one of the guys that were all for abiding by the rules and following them to a "T". Funny that you preach the virtues of cbers operating within the law but it would APPEAR from your statement regarding the rain report that you are well versed in hypocrisy.

At least I know that when you apply modulation to a carrier that the carrier level does not increase. Also that applying an AF signal to SBB does not increase the carrier. You don't know the basics, how can you claim to be an expert at designing amps for them?

C'mon Smokey. That rarefied world where HF meets VHF is kind of a cosmic mind-warp where the real-world rules and practices don't apply. Like the Red Queen in Wonderland, a word means exactly what it is intended to mean, no more and no less. More pills is better, SSB has carrier, coax length fixes SWR problems, and the gnomes come out at night to make 'shoes'. Get with the program, man.

WHY ARE YOU SCREAMING!!!!!

Eight miles must be on AM. I can talk over 25 miles on SSB from my mobile
without trying. I have also talked from Baltimore to Annapolis on AM from
my mobile. The antenna...a KW-7 Firestik. A Wilson 1000 works good, but
not as good as a full size antenna, and a hard ground always beats a magnetic
ground.

Tonyonebone wrote:

Rat Shack does have a 10/11 mtr antenna that works well for my boy. He has it on his pickup and it appears to work almost as well as my Wilson 1000. I know that it is not the choice of the "pros" but what works works!!!

A 'slew' being busted? When Riley and the gang catch someone, they hand out far too many warnings before doing anything. I would agree that there are more guys doing wrong than getting caught doing wrong. Truth is though that it is a much smaller portion of the whole compared to some other services with large numbers of participants.

There are plenty of people who DO care about mods that they may feel DON'T make it any better. I'm not one of them, but it's something to consider if you're selling something as "mint" using a definition that isn't standard...
Yes, it's your opinion, and you're welcome to it, but it doesn't mean you're right. Someone should buy it for your asking price, because it's a great radio and is worth what you're asking, but it isn't mint by the standard definition. And no, it's not THAT important, but mint doesn't mean what you are touting it to mean.
As I said earlier, cosmetic mint is not the same as integral, collector's mint. A slight difference but a significant one.

anything that Flaws the fine stature of "HAMS" is a joke or incorrect, we all know that not a single ham is guilty of any rule infractions, that includes running power in excess of requirements, and the legal limit! Your right, The ham bands are a veritable "UTOPIA" that has yet to discover the evils of the "COMMON" man!!

Jeremy,
Believe me, it's not something that you'll use very
often, except maybe to scribble on the back of. It's
a 'circular' graphing tool/aid in determining impedances.
Mostly out dated, confusing, and a royal pain if you've
never seen one.
'Doc

I'm looking for an upgrade radio to put in my Jeep. I know some brands can be touchy about vibration, dust or moisture. Does anyone have any thoughts on a good, tough, modifiable radio??

3's trees and bushes,

Richard

Ok here goes...sorry I guess I should have done this in the first place!!

The Washington Base Station..NOT MODDED 'cept for clarifier slide (2nd choice).I use this as my FULL time Base station. I like the ease of use and sounds great!...it does have a little 225 behind it which gives me a little help. Talked to Iceland the other day. First time in my life!!! And I have been lucky and talked to lots and lots of DX stations over the past 30 yrs as a CB operator!!

My 148GTL which has been Modded tweaked and tuned to the max. Is more of a flash from the past and even thou just it came back from the shop I use it as a spare. Would be a good choice ONLY if it is before soundtracker IMHO.

In my Pickup I use the RCI 2950 that drives a magnum 4500 using a Wilson 1000 mag mount. I LOVE this radio and if I had to choose radio's and have only one, it would be this model....the other 2950 I am letting my Son-in-law use in his truck..he loves it as well...One of the things I DO NOT like about this radio is that sometimes when you are changing channels/freqs it takes a couple of clicks of the dail to move it. This does not happen all the time but it is a bit unhandy in mobile mode!! Adding A Texas Star Sweet Sixteen when it gets here sometime next week!!

The HR2510 I really can not give a fair report on it. I just bought it used and it has problems on SSB ..my mode of operation 98% of the time..

The Cobra25 WX ST is a piece of S**T to the max...would not even wish that on my worst enemy!!!!! This radio is the one that changed me from a Cobra lover (the OLD OLD ones) to a 100% Cobra hater/basher!!!! I do not care if it is a commie radio that is NOT why I hate it. The Sound tracker feature screws things up (I am on my THIRD 25 in two months!) The output audio goes south...without or with the soundtracker button pushed in. The third one is brand new and still in the box which I had not even opened yet...thinking about either throwing it off the bridge into the river...starting a raffle to see who will win a change to smack it with a sledge...well you get the picture here I am sure!!!

On my base station I use a ABS 1600 Army big stick...which seems to work..but I like the ground plane type antenna better. .I am thinking of springing for

one of Jay's antennas looks good in design and in Kansas we have some very high winds and it looks as if it can stand up to that!!!

I have ONE more radio it is a Yaseu 101E that I bought brand new 25+ yrs ago..still kicking but it is now resting along side the 148 which is about that old as well...

>Thank You.

Hi my name is Robert Hunter!!!
i talk on channel 17 down in the hollywood/ft lauderdale area
my handle is 612 or river rat
im five foot two inches and definetly have a short mans shorty
and im new to this group
first off id like to tell yall that all of you suck!!!
just because my wife jakkie O got banged by a buddy that i was paying
to steal radios from people that had more watts or a better radio that
i did,,,my buddys name was exterminator and he really did exterminate my
wifes hot box (and the pisser was that i was passed out drunk in my
radio room)also i love to talk about cock on the air!!! so much that
some people think that i have obsession about cock
it prolly comes from the wet dreams i have about jakkie getting banged
by my best friend exterminator who i paid to steal radios out of
peoples car (yes i do condone stealing radios just because i want 17
to be all mine)but anyhoo to top it off im a terrible alcoholic i dont
see how wife hasent left me yet i guess she found a sucker to latch onto
that will pay the bills while she goes and bangs every tom, dick and
harry on the band!!!

heres my adress if you want free pixs ofmy wife
banging exterminator c/o
Robert Hunter
5400 SW 57TH ST
DAVIE FL 33314-7447

i will also e-mail them out
just drop me an e-mail
hunterb216@aol.com (be sure to mention Jakkie O banging exterminator!!)

well gotta go and beat my meat to these hot pix
bye for now --- River Rat (612)

Well I'm not exactly an ancient relic, but i did become interested in radio at the age of 10, at 11 i had a hammarlund HQ170 and a Johnson Ranger, (used it on 11 <GRIN>) .... have had just about every cb there is, quite a number of ham rigs also! have listened in on the bands since then, that was nearly 30 years ago, The ham bands have progressively worstened over the years!! It makes me wonder why i bothered in may of 98 to take my Tech test then work my A$$ off and upgrade to Extra at the end of June 98.... If the Ham bands were as populated as CB is it would be a real mess on a 1 for 1 basis Amateur radio is every bit as bad as 11 meters! LETS MAKE THIS STATEMENT CLEAR!

If the number of Operators Existed on HAM BANDS as do on 11 METERS, on a 1 for 1 basis I BELIEVE you would have just as many good operators as CB, and just as many bad. I have no magic formula to support this, I'm not a social worker, These are my opinions, right or wrong I'm entitled to this! I base my opinions on not only 30 years of listening to the garbage, but also the seeming trend that goes with it.... I'm not an Angel, I'll occasionally rattle some poor truck drivers cage, but i'll sit and have a great round-table discussion, with a lot of good people on CB and Ham bands.. To say ALL or EVEN the Majority of the hams are law breaking malcontents would not only be incorrect, it would also be an outright lie! And to say the same about CB would also be a lie! People will be People, good and bad in every crowd!

I'm far from perfect, plenty of room for improvement, I'm not JOE TECHNOWIZ, plenty of room for learning! At least i admit it! I will try to share my knowledge and be helpfull as possible. My Interests are on both sides of the fence! The FCC, the operators, everyone is guilty! We all bitch and complain about this and that, and typically no one trys to make anything better! If a CBer or Ham Comes to me with a problem I will treat them on equal terms and try to help! If a CBer comes to me with an amplifier problem i will do what i can to help, I won't call Him an idiot and point out that he's running illegal power, I'll do what i can to help. Maybe he won't see all hams as thinking they are better than him, maybe he'll even become a Ham!

All the Griping and Whining out here! If all that energy could be put forth in a positive manner things could change! Finger pointing and insults do absolutely nothing to further anyones hobby!

I'm as guilty as anyone else out here, I apologize if i've insulted anyone, however there is plenty of guilt to go around!

73's all, Have a GREAT WEEKEND!!

PS: forgive any poor grammar or mis-spellings, I'm just dumb HAM/CBer

I wouldn't waste your money... the Wilson5000 really has no benefits over the Wilson1000. It does however have one major disadvantage... it costs more.

You would think this would be goof proof but not so. They press the base onto
the antenna and they can make bad contact between the element and the base.
Have only seen one with this problem but what a PIA to figure out the problem.
It was really hard to admit that something could be wrong with the antenna and
try a replacement.

4647. Re: Smith Chart; Need Online Image

An original probably will be tough, however try to get the Value of the dual controls, a large number of radios still use that arrangement for controls.. your radio shop should be able to compare it to some other makes/models of current production and find a replacement that will work.....

I was going through all of my CB stuff today, reorganizing and hooking stuff up and it occured that I have accumulated a lot of stuff of these past 5 years. What would the following list be worth as a whole package?

Uniden Washington-Unmodified
D104 With 10DAL Head
EEC Mity Mark One Single Tube Amp (6JE6A)
Palomar 225
Samlex SEC-1223 Power Supply (20 amp)
Tripp Lite Three Amp Supply
Euro 3900-Unmodified except for conversion
Vectronics 300 Watt Antenna Tuner
Uniden PC-66
Cobra 77x

That's all my CB stuff. I don't wanna sell it but I just want to know how much would all this stuff go for, say, on eBay or something. Thanks!

PB

Not at all, your answering my sarcastic remark speaks fo itself! You certainly seem well versed at making critical assumptions! It is the general consensus of a few folks on this NG..... The rain Report, a joke??? I think not, lacking, possibly needing more effort, certainly!

Please explain what there is to be jealous of? make myself look good??? I could care less what you or anyone else out here thinks of me... certainly your able to come up with a better analogy than this, or have i possibly struck nearer to home than you wish to admit?

73's hope your having a great weekend!

try a truck stop near interstate hwy. They carry all kinds of
antenna's I have a cobra 29 ltd, been peaked and tuned with echo
board. I don't run extra power, just stock it puts out about 12
to 15 watts with wilson k-40 antenna's. Make sure both of your
coax's are same impedence, test with ohm meter and are 9 to
12ft. tune antenna's use swr meter. works for me, I can talk
easy 8 or 10 miles on flat ground

Just a rough guess if it were all in pretty decent shape, probably 700.00
give or take 100 or so, thats probably less than you have in it,
buying/selling especially on the net here is quite different than the
real-world, I always expect to get more selling a piece on ebay, guess its
the competitive nature, however sometimes things don't work that way
either...

You've heard the old saying "birds of a feather flock together"?

Now you know how I hate to make unfair generalizations. But more than one poster has gleefully pointed out certain ham frequencies as evidence of widespread ham wrongdoing.

It is quite evident that no ham you've ever seen post here has tried to say that ham wrongdoing doesn't exist. To say that hams attempt to pretend they don't have faults is absurd. If that were true, they'd be suppressing the Rain Report (published by hams) and shunning Mr. Hollingsworth (instead of featuring him as guest speaker at ham conventions).

This brings about a question that I feel has yet to be adequately answered.

I wonder why, with the relatively vast spectrum assigned to amateurs, and all the thousands of ordinary QSO's happening on hundreds of frequencies daily, a person would go to the effort of tuning in at specific UTC's to specific frequencies with the sole intention of hoping to hear hams misconducting themselves.

Ordinary ham QSO's do not interest him. One might theorize that such an 'avid listener' and seeker of ham troublemakers is drawn to them by a fervent wish to participate. But since he does not have a license, he can only dream of someday joining them. Or perhaps he does already participate on occasion. Or perhaps just hearing hams acting irresponsibly makes him feel better about his own questionable 11 meter activities.

"Like attracts like", as they say, and in this case we are talking about a very small minority of on-air knuckleheads, many of whom enjoy violating both Ham and CB rules equally. A few of these knuckleheads even frequent this newsgroup to compare notes with each other.

Of course, this newsgroup isn't a fair representation of CBers. If one were to go by the posts in this newsgroup, one would conclude that the average CBer is totally obsessed with RF wattage, illegal frequencies, and megawatt amplifiers.

Source record: 38445

Quote from Doug DeMaw's Antenna handbook:

The ideal location for an SWR meter during matching adjustments at the antenna is where the feeder connects to the antenna. If this is not practical for you to do, use a 1/2 wavelength of coaxial cable (velocity factor used when cutting the line to length) between the antenna feed point and the SWR meter. The 1/2 wavelength (or multiple thereof) line will "repeat" the impedance that is present at the antenna feed point.

Your example of the "odd" quarter wave works as long as the coax has a velocity factor of .66. What happens when you use on of the foam type of coax that are used by quite a few antenna manufacturers?

The 18 feet that is recommended by manufactures, with no account for velocity factor used, is probably due to the physical length of the coax (physical 1/2 wave). They are trying to establish some sort of counterpoise for antennas that aren't installed correctly, with thought to proper grounds. How many manufacturers have a recommendation for coax length with base antennas?

Some folks do discuss, amplifiers, out of band mods and other
illegal activities as you have chosen to put it, However i think your
conclusion is as narrow minded as you are. After all is this not
"rec.radio.CB" i don't see it as "rec.radio.cb.laws", or
"rec.radio.hamsbashcbers" look back at the posts, if the problem isn't
some troll, or an idiot just trying to get some attention its a ham bashing
a cber for whatever infraction it is..... and its typically the same few
hams! why do these hams feel the need to do this? Now you will notice i
have said "A FEW", not "MANY" or "MOST"! Hey some of the Hams out here are
even trying to help, and actually offer courteous, helpfull, and valueable
input! I understand your need to defend amateur radio, you should
understand the same, you should also understand it is you who is the
visitor. The CBers of this group are not running around the various amateur
NG's seeking folks asking for mars/cap radio mods and posting it may be
illegal to do.... Why does it bother you so much if a someone posts here
regarding a DaveMade 10kw amp??? in reality what difference does that
event make it your life?

If one were to

<< Why does it bother you so much if a someone posts here regarding a DaveMade 10kw amp??? in reality what difference does that event make it your life? >>

Two points: One, I am also a CBer and believe, like many others, that the use of high power amplifiers ruin the band for others.

Two, when someone attempts to defend their use of a DaveMade 10KW amp by pointing out that amateur radio operators have shortcomings, you should not be surprised that those who see the flaws of such logic post opposing views.

Snip

You are a CB'er? Could of fooled me.

I just checked every post of yours. Yes I said every, not many, not most. and you do not behave like any helpful CB'er at all. Every, yes I said every post by you since 5-10-00 is, or was a put down of a CB'er, or a defense of amateur radio by the means of putting down CB radio.

When are you going to start acting like a real CB'er and start posting helpful, useful, wanted information? Do you have that ability within you? Or do you just like to complain all the time?

i run a xforce x400 in my pathfinder on a on a 105 amp stock alternator on a star gun antenna , i can honestly say that htis is one of the best amplifiers that i have ever ran, i drive my amplfier with a superstar 3900 turbo and getting about 550 wattts key up and swing to 1400 watts peak watts power on a bird meter, the amplifier is quite large in size , overall it is a great performing amplifier, comes with a built in cooling fan ,i have been in the cb business for 20 years and i have come across many amplifiers, but none quite like this. good luck i hope this helps you. 73's

Yeah sure ok, we all know where most of the big amps run, i'm quite sure
you attempt communications on the Bowl....

I assume you think griping to the newsgroup will change all that!!!

ODD?????? I've never seen anyone attempting to justify running an amp by
pointing out "shortcomings" (how cute, shortcomings) Rather the posts i've
seen involve a person asking a simple question, then the HAM feels the need
to point out his "shortcomings" (again how cute), and finally we see
retaliation!!

Please quote a post regarding a Davemade or any other amp that started out
by saying "I use a Davemade because of Joe Ham's shortcomings!!"
LUDICROUS!

So tell me, the operation of a 10kw Dave is considered a shortcoming??
Or do you reserve the use of that term to soften the illegal activities of
your fellow hams?

Flawed logic ABOUNDS!

To measure high currents like that you will need a calibrated resistive shunt type ammeter... or an inductive pickup type. Probably not a cheap undertaking either way you go...

Hello Mark: I would use a 150 amp fuse, mounted near the battery, in a manner that would be out of harms a way.

The Amp Meter, you don't want to run the heavy wire from the battery to the cockpit and then to the amp. You want to use a shunt that is a 150 amps at 50 Milli Volts. The shunt acts as a very small insignificant resistance that will run the 150 amp 50 Milli Volt meter. This says ya from running large wire all over the place. The fuses and fuse holders, and shunts and meters are available at Motor Home supply outfits, or your local auto audio stores.

Oh yeah don't forget to use at least 2 gauge wire, for the - + from the battery to the amp. Its available at welding supply stores. Make sure the + wire is well insulated going thru fire walls and such.

Jay in the Mojave

I agree. Most of the time, someone is asking an honest question, and when it is sincerley answered, someone else will jump in, and make degrading remarks. I guess we could stand a little "dressing down" at times, but we also need to help when we can...

I didn't come back with a new story, and I don't have
to defend my statements. People that have been on this
newsgroup for awhile recognize me as one of the most
knowledgeable regulars out here and they either believe
me or they don't--most do. I quit defending every
statement I make out here a couple of years ago because
it's just not worth the effort.

>could be disabled (as in taken out of the circuit)?
>

NO... Uniden's Dynamic Squelch is simply an automatic squelch control. It sets the squelch to automatically block out any signal below the noise level.

How well does it work? Well, it is not perfect. On VERY noisy channels, such as 19, you may never hear the squelch close.

It has no affect on transmit.

The SoundTracker function on the Cobras can be turned off at the push of a button, so, you can operate without it.

4700. You call yourself a CB'er?

Newsgroup: rec.radio.cb
Date: 2000-06-03 00:00:00 UTC
From: tnom@mucks.net
Message-ID: <vh4jjscglrqus180vc15m8p89m9e7mqp47@4ax.com>
Source record: 38621

After hearing JarryLaw profess that he was a CB'er I couldn't help myself. I thought I would show that if he is a CB'er then this is the type of CB'er he is. Posted below is a message that he authored on 1-18-00 and posted to Rec.Radio.Amateur.Policy
Begin quote:

##

"With the CW requirement eased to 5WPM, CBers are VERY interested in ham radio. And they're excited about bringing the CB culture to the ham bands."

" A few posts from rec.radio.cb:"

---

how many of you guys think that we will see a new breed of HF rig appear soon ....one that will appeal to CBers that are going to make the jump to low band rag chewing on 80,40 , 20 you know like maybe a rig that will boast a 150 watts output instead of a hundread , a low cost built in atenna tuner ,so you can work 10 and 11 with same antenna , good modulation pn AM instead of that lowl level modulation crap. something you can turn up the ALC to get some audio ,,lots of fancy lights big meters oh god those big chrome knobs.............i bet yaseu will come up with a rig with all the features a cber will want ....under 800.00 a new era rig is comming and watch radio shack they ll make a hf rig to i bet.........easy mod to 11meters ....well lets get some input what kinda features would yall like to see on new era Hf rig.............BusDriver

---

>Are you a ham now? If so why freeband. Your only gonna talk
>on 80 if you upgrade to general or above.

i'll be just as loud on 80 as i will 11. >>

---

hey toll, i'll look forward to you whooping me on 80 soon, we should be able to qso real nice since wee about 60 miles. bus is gonna have two loud cotton pickers to deal with, although i'll be the quiter lol.

>> > | Hey Tim,
>> > |
>> > | I'm gonna put the maul on you on 80...>>

No kidding.

I just picked up a 4CX5000A for 200 bux...

That ought to make a nice standby amp.. 100 watts in, 10,000 pep
out!

Kenwood will drive that nicely, I suppose.>>

End

##

And then he posted this in Rec.Radio>Amateur.Policy
Begin quote:

"More actual posts from actual CBers in rec.radio.cb who are headed
your way:"
****
I am new to ham radio and am wanting to get a license. I downloaded
the technician question pool from ARRl and have been studying it this
weekend. I was hoping to take a test next weekend. I think I
can memorize the questions but truthfully do not understand much of
them. Thankas for your help!>>

End

##

If he is a CB'er then exactly what type of CB'er is he?

A pair of 100s at the source.

> Also I'd like to monitor current
> flow.Where is a good source for a high current ammeter and
> fuses?

Tool trucks like Snap-On and Mac have
good inductive ammeters that can just
be put over a DC wire when you want to
take a reading. I use a Mac unit for
quick verification of input power in
the field. Using a 50% efficiency
factor, you can derive the average
output power from under-load DC current
and voltage measurements.

> Thanks.....Mark

Have fun.

4704. Diode Clamping, A thought.

Newsgroup: rec.radio.cb
Date: 2000-06-03 00:00:00 UTC
From: Frizz <senorpurpl@hotmail.net>
Message-ID: <8hc5od$hj6$1@bob.news.rcn.net>
Source record: 38625

I guess this might be an off the wall theory but I have been toying with how it might work for CB. In some guitar effects pedal operations, such as a distortion pedal, a simple back to back diode clamp is used to clip the top portions of a wave form (if memory serves...). Say a small box was constructed that included this diode setup and was attached to the output of a transmitter or amp stage. What would this do? Would it clip the wave form artificially like it does with audio/guitar type equipment? What would the result look and sound like to the recieving station? I know this seems like an off the wall kind of idea but I thought it might be something interesting to toy with for experimental and fun purposes.

Thanks, for the post! it just proves my point, JERKS like him don't belong on radio, PERIOD! If all the Hams had his mentality the community would have dried up long ago! The quote I left in, Is the attitude of "MANY" hams, yes i did say many, meaning more than FEW, but less than ALL!! What they don't realize is without new blood in the hobby eventually it will be so small that The precious band allocations will slowly be auctioned off for NON-USE!! and will forever be gone! Why the hell ridicule!!! because he's better?? I'm sure he thinks he is!! obviously this person he quoted was in need of help and advice!! But what the Hell make him the Jester, Why help the newbies

You Sir, JarryLaw or whatever name you choose are a pathetic example of an Amateur operator! You are Exactly the Type of HAM i look down upon! Thank GOD you are NOT representative of MOST, OR MANY, of The Hams! You are much worse, than any 10kw pavement pounding CBer! Because If the radio hobby ever dies it will be to the blame of you and the pathetic like minded CRONIES, Who feel they are so much better than a Cber or any other person new to the hobby!!

WAKE UP!!!! YOUR NO BETTER!!! AND IN REALITY MUCH WORSE!!

Well Gary, I don't because i'm not here attempting to impress anyone, I'm here trying to help some folks, enjoy my hobby, and learn..... Since you certainly seem to think your an authority, enlighten me? why should i care?? either the people on here disagree, or agree, simple as that! I absolutely DETEST Hams who think they are better then a Cber simply because they are Hams! when i see a STUPID post i respond with my opinion, Its just my opinion it makes no difference in your daily life nor my own. Right or Wrong my life, your life, and everyones elses goes on! If you or I have had enough we simply filter the person out or leave the newsgroup! You owe me nothing and I have no debt with you. Your opinion is the only thing I know about you, and mine is the only thing you know of me, and it will remain that way. So what does it matter??? I could choose to change my ISP and come back posting here on the opposite side of the fence using my Call and you would pat me on the back. I simply don't care, my opinions i have expressed are my own! right or wrong!

There are speech processors out on the market that work on that principle.
They produce a very distorted audio signal and sound poor. For a guitar...
yes... for audio.. no way!
You want a real speech processor like can be seen at

Don't think a Smith chart will do you any good for what you want to do...
You have all you need anyway! Just take the forward power and reflected
power and corelate to an SWR. For example:
SWR of 1.6:1 = about 4% reflected power
SWR of 2:1 = about 11% reflected power
SWR of 3:1 = about 25% reflected power

Thank God! Finally someone who makes sense concerning the sound tracker radios. Just leave it off it you don't like it. I'm sure Cobra will drop it because of the "urban myth" that has grown up around it. (it's bad! It's bad! Oh God they ruined a perfectly good radio with it!)

I remember when people went out and paid $100 plus for a DSP-40 to add to their CB. (Or a simular product, I personally prefer the Timewaves or JPS models at three times that price).

So Cobra thought, "Hey, why don't we include this technology built into the CB with just a push of the button! Those who want to use it can just push a button instead of spending $100+. Boy I bet our radios will sell better if we do that."

I guess part of it is Cobra's fault for making people think it was going to work some kind of magic. Then the average Joe CBer buys it. Doesn't do anything for him because he doesn't DX on a regular basis and doesn't keep a log where the ST might make a difference of whether a staion gets added to the log or not,(maybe 3% of the time in a year?) so he gets pissed off because he paid the extra $25 it added to the cost of the radio (instead of the $100 he would have gladly paid Radio Shack for the DSP-40). And after all it hasn't made anyone on channel 19 sound any better! So it must be bad. Come to think of it, he's so pissed off because he can't figure out how to use it properly he'll just call it "sound trasher" instead of "sound tracker".

Go figure.

Debbie & Quad:

First of all, you didn't answer the man's question. The Dynamic Squelch Control is an automatic squelch control and is made for grubby yuppies that have become truck drivers that are too lazy to set their squelch controls, so they came up with the BEST feature in 30 years that automatically does it for them! It is NOT the same as Cobra's SCAM (I mean sound) Tracker Chinese made TRASH by pinko commie slaves where their govt. gets 90% of what they make & the workers get 10% or less. So, DEBBIE, BE an American & QUIT selling that TRASH and you won't have to explain why it is SUCH JUNK to your customers compared to the Uniden equvilents! Don't buy Cobra! Buy Uniden! They use to make Cobra's CB's when they were good ones from the Phillipines!!!!! Sell QUALITY !!!!!! They do NOT eliminate NOISE! If the box or CB said that it FRIES EGGS, would you believe that too? Dave!!!!!!!!!!!!!!!!!

Debbie Hicks wrote in message ...
The sound tracker can be disabled. If it is indeed malfunctioning with all on this group, send it back to cobra. It has a two year warranty.

I sell them all the time. When you purchase something that is too eliminate the noise then it will do just that. Be careful not to expect the noise gone but range the same.

Use an EQ to eliminate the undesirable noises that you are hearing without compromising the range.

Be sure if you have clipped and snipped to put it all back together before you send it to cobra.

I have never had problems tuning these radio's. I have had a few (not many compared to the amount sold that developed a receive chirp or have a choppy receive.) Prior to selling a unit I let the customer know about the problems encountered. The likelihood of them having the same problem and where to send it if it does. Cobra will take care of it.

The Uniden Dynamic Squelch Control is wonderful as well.

>Again, I'm not sure what he was attempting to convey there.

snip

Had to snip because the thread was getting to big

Just got done running some numbers. Some what crude
and without great resolution but it does show the phenomenon
that I spoke of. Namely broadening the measured SWR at the
radio.

I used EZNEC to frequency sweep a 40 ohm resonant antenna.
The only switch I made was the transmission line length that fed
the antenna. EZNEC for some reason does not allow a 0 degree
transmission line length so I used 360 degrees. I then just took
another measurement with the length of 270 degrees which would
represent 18 feet of 66% coax at 27mhz.

Results:

For a 300mhz antenna the 3/4 wave trans line had a
3:1 bandwidth of 34mhz

The full wave trans line had a 30mhz 3:1 bandwidth.

Frizz,
If you do it on the audio output of the radio, on the speaker leads, it does provide a crude form of audio clipping. Can't hurt anything, give it a try. I really don't think you'll like the results since it does distort the audio a bit. It does sort of take the 'pop' out of static crashes.

4726. Re: SWR question

Newsgroup: rec.radio.cb
Date: 2000-06-03 00:00:00 UTC
From: Richard McCollum <rmccoll@radiks.net>
Message-ID: <Kfl_4.1502$EU3.8034@newsfeed.slurp.net>
Source record: 38647

Not being an expert on any of this the only thing I can add is the benefit of having been there in 1956 when pi-section outputs were just coming into vogue. First, it is indeed easier to match a 5k plate resistance to a higher impedance load. Secondly, by doing so the reactance changes over a band of frequencies are a smaller percentage of center and therefore give the op a broader range for a given setting than at any other point on a mismatched feedline.

Just what this might have to do with solid-state lo-impedance fixed-tuned amps is beyond me. When your rig is a Gonset Communicator using Heising (choke) modulation, you tuned for maximum field strength or maximum smoke for in those days SWR bridges didn't exist. You did resonance checks with a grid-dip meter and tuned with a 20 watt fluorescent tube. Actually worked pretty well.

Looks to me as if George has it pretty well figured out.

> That is a quote from the Radio Handbook, 1956, by William Orr
> Chapter 23, Mobil Equipment and Installations, Section 9
> Mobil Antennas, Page 468

William Orr is certainly a respected individual in the field
of antennas. I can only speculate as to why he said this.
He gave no indication that it would improve SWR. He merely
said that it would minimize loading variations. He may have
felt that it would be easier to match his transmitter to the
higher impedance seen with a quarter wave transformer inverting
the impedance of a low impedance antenna. Transmitters during
that period were virtually all high impedance vacuum tubes.
Thus, it would be easier to match to a higher impedance.
Again, I'm not sure what he was attempting to convey there.

> length will work, but the phenomenon above is one reason that
> some mobile antenna manufactures recommend 18 feet of 66%
> velocity factor coax.

Which phenomenon are you talking about? Regardless of which it is,
I don't believe that any are valid reasons to cut to 18 feet.

I agree that 18 feet will be about 3/4 wavelength which is
electrically equivalent to 1/4 wavelength. However, I don't
think this is the goal of antenna manufacturers. I believe
that they want 1/2 wavelength to common mode currents on the
outside of the coax which also happens to be 18 feet. Again,
either way, I see no benefit so I can't be positive as to
what they are thinking.

Let me add one more perspective on the cancelling effect that
you describe. This may help clear it up.

I think we both agree that 1/4 (or 3/4) wavelength of transmission
line has an inverting effect on the impedance. Low resistance
becomes high resistance, high resistance becomes low resistance,
inductive reactance becomes capacitive reactance, and capacitive
reactance becomes inductive reactance.

Now, your cancelling theory claims that, as the frequency sweeps
up and the antenna looks more inductive, this inductance will
cancel out some of the capacitance that the coax makes you see
on the input.
The reality is the exact opposite. As the antenna appears more
inductive, the inverting effect of the 1/4 wave transmission line
will actually make you see more capacitive reactance on the coax
input. There is no cancelling effect; it is an additive effect.
And this additive effect makes perfect sense -- as you worsen
the match at the antenna you worsen the match at the coax input.
This is in perfect agreement with the fact that the SWR is constant
at all lengths of coax.

The SWR is constant at all lengths of transmission line. Since there
is no need to "repeat" the impedance to get an SWR measurement, I'd
have to say that Doug DeMaw is a dope for saying this (assuming that
he did indeed say this). You can tell him I said so.

Now, you may want to "repeat" the impedance to get an accurate
impedance reading with an impedance bridge. Then you would want
a multiple of 1/2 wavelength. Are you sure he wasn't talking
about impedance bridges? Was that a direct quote? ...or did you
paraphrase?

I agree with the "some sort" part. They are trying to establish "some
sort" of something. I'm still waiting for one of them to tell me what
it is along with some valid reasoning.

4742. Comments on Cobra 75 WX ST mobile (All in mic) CB radio.

Newsgroup: rec.radio.cb
Date: 2000-06-04 00:00:00 UTC
From: BLY <bly213@nospam.att.net>
Message-ID: <c3j_4.2281$2b4.147867@bgtnsc06-news.ops.worldnet.att.net>
Source record: 38465

I am thinking of buying a new Cobra 75 WX ST CB radio for mobile
operations (traffic reports mainly while on vacation or traveling).
I don't have the room for a big or medium CB under the dash, so I
may have to go with something like the "Cobra 75 WX ST" which
is the CB radio with all the functions and channel readouts etc. built
into the microphone. Nice Stealth rig is what it buys you for one thing.

I am wondering if this Cobra unit uses the same circuitry as the
Cobra 148-GTL and if its audio modulation can be adjusted like
the other Cobra's and Uniden's. Is it modifiable? If not does it
put out a good signal and audio stock?

Comments please from anyone who has one or who really knows.

Thank You.

Bill (OctaQuad).

Out!

>What amperage fuse should I use inline?Also I'd like to monitor current
>flow.Where is a good source for a high current ammeter and
>fuses?

Car stereo places may have the fuse and holder you need. It's called a wafer fuse, and you come directly off the battery to it, then to amp. I'd run either a 150a or 175a fuse.
I'd just run a simple volt meter, if you drop more than 1.5v under load, you're not getting enough amperage.

Orr is right . Remember this is basically before transistors and the tube output networks did not handle 25 ohms very well.At least this is way down on the fringe of what they would handle. They were designed to handle a little below 50 to about 150. By using a 1/4 wl section of 50 ohm line this transforms the 25 ohms of the antenna to 100 ohms which is easily matched to the tube equipment. This has nothing to do with broadbanding anything

BTW it is easy to calculate the impedance that you will see at the input end of a 1/4 wl(or odd multiple) line section. Divide the impedance of the line by the impedance of the load. Now multiply this number by the impedance of the line.

Example of 50 ohm cable terminated in 25 ohms.
50/25 =2
2*50 =100.
This is very easily verified on the Smith Chart

I turn mine off and remove it from my truck whenever I leave it parked
somewhere. When I hook it back, the mod is still there. This power thing
is not true.

4752. Heatsink/cooling fan Hack using 486 sink/fan module

Newsgroup: rec.radio.cb

Got a cool hack to help cool tweeked up radios that do not have an external heat sink for the RF power transistors. The hack is very clean, looks good and is cheap! It uses a 486 CPU cooling module. The module is a small heatsink with a 12 volt fan attached. You could find the heatsink/fan module at any electronic supply store. Got mine from a major electronics super store. You can see a picture of the installed module and a description on how to install it at my web site. The radio that was used for the hack is a 148. Go to:
www.rfllabsinc.com at the bottom of the first page click on the link:
"RFL LABS Truck and other cool Hardware Hacks"

KW,

While the broad-banded antenna is more "convenient", it "should" be less efficient than one that is narrow. Generally speaking, the "big coil" antennas would be more efficient AND narrower than the smaller ones. That's according to prevailing antenna theory, and that is, of course, more prevalent on lower frequencies such as 75 meters. Can you tell me how a "big coil" can be broad banded and more efficient at the same time? This is not a trick question. The idea of larger inductors and broad-bandedness is contrary to what I have studied in RF theory. What am I missing here?

Best 73

Jerry

The ones that dentists use to make incisions and cauterize the wound are nothing but a pretty standard MOPA (master oscillator, power amp) that remind you of old WW2 stuff. They make a real good CW transmitter. Now that CW is down to 5wpm and probably due to disappear for ham licenses, maybe it is time to stage a retro revolution in radio :=)

Jerry I'm not an antenna designer, I have read some antenna theory
and made a few homebrews, However i'm certainly not well versed. I build
my HF antennas and mess with some VHF home brews, but Have only thought of
making an HF mobile antenna... I understand what your saying but cannot
give any legitimate theory as to why, I can only tell you that the results i
obtained were only casual tests and have no idea if they could be
reproduced. As i stated all three were very close signal wise. I've found
a place that sells the nugatron with the help of a gal here on the NG,
(Thanks Drbbir) I should have it sometime next week, I think i may purchase
a predator 10k also. possibly in the next month or so i will do another
comparison I still have the trusty 102 SS....

You can get the same effect by simply driving an rf transistor into saturation. The waveform on a scope shows up as flat so this is called "flat-topping". A little of it doesn't hurt a lot in either AM or sideband but carried to extremes it sounds like garbage. Listen for an overdriven amp and you will know what you will get without doing it.

Remember as well that any distortion of the rf envelope produces harmonics. If you find a way to do it with diodes, beware of a committee of your neighbors bearing torches and a noose. Hope you don't have a tower or live near tall trees.

You have me confused now, so I think i'll just ask two questions.

1. Can a Texas Star be legally purchased or owned by a
amateur? The reason I ask is, as far as I know, it has never
been approved for amateur use.

2. Can a CB'er own a Heathkit? (mere possession) Now I already
know this answer but what is your opinion?

3. Can a CB'er (mere possession) own a Texas Star? This answer
I am not sure of.

if you spend most of your time on SSB go with the uniden, while the Deltaforce is a decent performer on SSB i'll give the edge to the uniden, if you spend most of your time on am or fm get the deltaforce, if you are or intend to become a ham and will be using the radio on 10 meters go with the uniden, you'll also probably need to pick up the chipswitch for the lincoln, adds about 50 dollars to the price not counting installation....

It won't work at rf frequencies as you would desire.

If it did work - it would clip the peaks. The result would be a very
poor signal will all sorts of harmonics and splatter.

:>antenna coupling coil, should be approximately 5 feet 6 inches."
:>*****************************************************************
:>That is a quote from the Radio Handbook, 1956, by William Orr
:>Chapter 23, Mobil Equipment and Installations, Section 9
:>Mobil Antennas, Page 468

This is completely logical - and has nothing to do with the SWR of the
system. It simply places the lowest (or highest) input impedance that
the transmitter sees at the center of the band. This, as Bill states,
"minimizes loading variation".

>difference. The difference was in amplification factor, the 3CX had up to
>200 times amplification factor were is the 4CX only had 4.3
>The 4CX had more output watts but less amplification factor. Can someone
>explain this? and what's the better tube and why?
FWIW, the 4CX range seems to be gaining in popularity in both ham and CB
fields.

I chatted with Toll about this in Tyler.

It seems the 4CX's have more gain, thereby less drive for a given
output. That no doubt leads to less draw on the alternator/s!

Am I correct in that Bluegill currently runs a pair of tetrodes?

I can only apologise if you thought I was having a dig. These radios do the job more than adequately. I still think the best HF SSB rigs tx wise are the old ft102 and ts 830 which are getting on to 20 years old. But as Budgie made the comment the ham fraternety want to think this stuff is the bees knees. If you can get one for 2 metres try the Midland or AWA rigs the programmeable types. 50 w output nice radios.

My comments where more meant to be directed at things like ACA not allowing linking of repeaters for years, we are supposed to be at the forefront of technology and linking of repeaters etc has really only come into it's own in the last 5 years. Even the ridiculous requirement that your transmissions are not allowed to be retransmitted on a band your not licensed to use. Most other countries requirements are that if you transmit on the band that you are entitled then what ever happens to your signal through links etc is not your problem. For example the blind eye turned to Limited licences using satellites prior to the 10m enhancement.

I could get side tracked here but thats my thoughts

Actually it does work as he would desire in spite of the splatter. This is the idea behind a "modulator" type amp. The trouble with doing this with diodes is find some that work at these desired power levels that switch fast enough. Power diodes usually start having trouble at way less than 1Mhz. On the other hand it can be done at low levels using high speed switching diodes then amplified. The advantage of doing this is that it gives you a chance to clean the splatter. This is basically what goes on in an RF speech processor. It is still easier to use an amp that is driven into saturation than using the diodes.

>The 4CX had more output watts but less amplification factor. Can someone
>explain this? and what's the better tube and why?
Further to my previous post I came across this on the Amps reflector and
thought it would be of interest:

The 3CX10,000A7 drives with 1500w.

The 4CX10,000A drives with 150w.

55 in Fla come in please, your time is up.

I have a Galaxy 77 and a Superstar 3900 Gold which will both swing to around 30 watts on a dosey 4002 meter. Does anyone know if this super modulation kit will allow it to swing to 50 watts? This is not a standard "mod kit" that is installed between the driver and collector supply power/ high level modulation circuits. I have a messenger 500 HD amp, which I have been told by more than one source needs 50 watts of drive to even come close to doing 500 watts. If anyone knows the answer to my question please respond.

Where can one buy these LMR400 or RG-213 CB cablesin 100 feet lengths?
My local RS store only has thick RG-8 in 50 feet lengths max. Too bad.
Where do y'all go shoipping for cables these days? CB scene is so dead now,
that hardly any stores stock the stuff anymore!!!

Bill,

Out.

There's no absolute need to have exactly 4 wires as a ground. You can have as little as 1 or as many as you like. The more the better is the general rule. If you have a carpet you could hide the wires under that.

If you want to try something cheap and cheerful (definitely cheap). Have a go at the inverted V that I mentioned in another post.

Get two lengths of wire, (about 109" long to be on the safe side). Atach one to the inner part of the coax and the other to the outer part of the coax, (I used to use the "chocolate bar" type of electrical block connectors for that).

Fix the end of the coax high up the wall. Stretch out the two wires and fix them to the wall so they look like an upside down V. The coax should come straight down the middle.

Trim for best SWR by taking equal bits off of both ends between each reading. (Don't cut too much at a time)

The only thing to remember is to make sure that the angle of the two wires is not less than 90 degrees and not greater than 120 degrees.

Performance, in my experience, is as good as any mobile on a biscuit tin.

That's what I used to use here in the UK during the good ol AM days. It was the best alternative to an outside antenna although mine was up in the loft.

Does anybody schematic info, or a website where I can find service info on an RCI-2950? It seems that somewhere in the power distribution, this rig took a dive. I picked it up in a swap. The symptoms: no display, no display backlight. The unit is drawing about 330mA, and there is noise from the audio amp, so some of the power distribution in the unit is working. I took measurements on some of the 100 ohm decoupling resistors, and no voltage. I have the feeling that there is just one break in the power supply net; I just have to find the break! Any help would be appreciated!

Pete Gianakopoulos
Chicago, Il.

<Paul> wrote in message
news:39357212.6627541@news.mindspring.com...
: In reply to the CB thread:
:
:
: There is a very old "American Survival Guide" magazine
that deals with
: the topic of CB radio in depth. I think it was either in
'91 or '92, but it
: really got me started "into" radio communication.
:
: A good mobile SSB radio with a 102" whip is excellent for
communication,
: consistently giving more range than the FRS radios. Don't
let the sheeple talk
: you into settling for the FRS radios if you intend more
than keeping in touch
: with your family while shopping at the mall or
Disneyland. I duggest the Texas
: Ranger 696 "F" model mobile am/SSB rig, shown here:
: http://www.texas-ranger.com/tr-696f.html
:
: This is a very solid rig.
:
: Remember, if you get your HAM license, you will be
subject to many
: restrictive operating regulations, and subject to
transmitting your name
: and address identification while operating on the HAM
frequencies.
: Sometimes you may wish to operate discretely, in which
case HAM
: radio would be less than ideal for you. I STRONGLY
suggest purchasing
: the back issue of "American Survival Guide" magazine I
mentioned earlier.
: I believe you will find it quite informative.
:
: Paul

What you should do is check into the NGs Rec.Radio.CB and
Rec.Radio.Amateur.Equipment, with Rec.Radio.Swap as well.

What you are wanting is what is called "outlaw CB". No IDs
but they often use Ham equipment. Not very legal, but then
Survivism is not much for the legal side of life.

However, given the huge amounts of ignorance seen in
misc.survivialism,
getting a Ham license might not be a bad idea. At least
you would
learn something about communication techniques and
technology.
Even Hams have dual "personalities" were they are legal as
Hams
but operate as outlaws in the bands outside CB and Ham.

And if you look at Bosnia, many of the folks there are
using ham
equipment. It is the most affordable, for the power,
telecommunications
equipment out there.

Swells8069,
I wouldn't even worry about an SWR meter, adjust for
the lowest reflected reading possible. Your doing the same
thing, just measuring watts instead of volts. Lowest is
best for reflected power.
'Doc

Hi,

>hey phil, how was the trip to dayton and tyler for ya?
Dayton was rather too warm on the first day and due to being too tired I missed out on a personal trip around WRW and Harris Broadcast.

Would of been nice to say, "I need to borrow one of them for a shoot-out in Tyler;!

Tyler was OK, a good turnout and as Toll or Peak will tell you it was only marred by a redneck getting out of hand one time.

I bought me a brand new Electrodyne E350-12 AC Powerhead which will be shipped with other stuff to the Uk in July.

Bean, if you're listening, J & N in Cincinatti are deffinately the place for alternators. Take your pick from new or rebuilt, Leece, Electrodyne or Neihoff.

The Electrodyne was less than jobber and will eventually power my 3CX3000 once the Suburban comes out of the paint shop and I gather a few more components.

55 out of Fla had a nice van with a second V8 in the rear powering 12 alternators.

Toll, Shadow and Peakaboo are now on my Christmas card list.

Was hoping to fly out again for Arkansas but am now bankrupt.

See ya

Phil / UK

I disagree with this..I think 95% of CBers or Shop owners when they discuss wattage are referring to peak watts...I`d be amazed if even 5% of guys who walk into a truck stop CB shop even know about RMS...Its just assumed in the CB community at large that wattage ratings given for any item are in peak form..Save the Bird RMS talk for tech to tech talks

I hope I did`nt brain my damage.

Cobra HH45WST handheld. Weather, Soundtracker, etc. Good condition,
9/10. Will throw in an 8-cell battery pack for free (worth $20). All for
$50 + shipping. I think I paid at least $90 for the radio alone, but I
don't use it anymore...

Email if interested at rjchen@stanford.edu

There is nothing in part 97 that would prevent it. Amateur gear is not type accepted in any way except for the two amps a year capable of 10 meter operation. There is certainly nothing preventing a properly licensed amateur from using it so long as he was willing to take responsibility for its operation.

>
> 2. Can a CB'er own a Heathkit? (mere possession) Now I already
> know this answer but what is your opinion?

Damfino. See 3.
>
> 3. Can a CB'er (mere possession) own a Texas Star? This answer
> I am not sure of.

I again do not know. I do not believe mere possession in a cardboard box in your garage is inherently illegal. Having it in line and plugged in is a pretty good presumption that it is being used illegally whether it is a Texas Star, Heathkit, or one the gnomes built overnite.

If you are looking for some dual-use loophole you have a big problem. CB use does require type-acceptance, no ham gear is CB type-accepted, probably cannot be, and to be able to market it in the amateur market would not even be applied for. The CB rules require type acceptance so modding the rig beyond the legal 40 shot that from step one. Your basic choice is between being hung for a sheep or hung for a lamb.

Does it happen? Of course. The Yaehoo 101 series with the infamous brown wire, the Swan Cygnet 270 and 300 becoming the Sillytronix 1011, etc. None of these made any pretense toward legality and none do now.

Given your propensity for seabag lawyering you should get a ham ticket; no bigger bunch of seabag lawyers has ever been invented.

Dick

Well, thanks for all the good buddies who responded to clear up my question.
I am glad that the Uniden "DSL" feature does not affect the transmit section
audio modulation like the Cobra "SoundTracker" does. When I get my GRANT LT
from Copper's (due in the mail tomorrow!) I will check it out first hand, to see
how that
DSL really works and if it is a worthless gimmick feature or not. Thanks again!

Bill.

3's y'all.

I`m sure thats true but if thats the accepted way things are then just go along and avoid the headache. Like the Professor said.As long as no ones trying to pass off peak as RMS (Which no one is) then why worry...Thats the way people are. Besides peak wattage is a completly legitimate form of measurement so its not like somebody just built a meter and replaced 100 watts with 500 on the scale..THEN you`d have a complaint

I hope I did`nt brain my damage.

Speaking of loopholes..........

1. A non licensed individual can not have a CB in line with a amp.

2. However this same individual can have a940 in line with a amp.

In other words....It take ownership of a CB, or a documented
transmission before number two is illegal.

It's not about making anybody happy. It's about loopholes.
The fact is, you are not under the control of Part 95 or 97
unless you own a CB, or it can be documented that you
transmit.

Thanks again to all the Good Buddies that repsonded! I have decided that I will foot the bill for a new Wilson 1000 Magnet Mount modile antenna.

I was looking at that top of the line Radio Shack antenna with the exposed coil spring
for $49.95. But that would attract too much attention and that I do not want to do.

Bill, out.

Nothing personal but I'm not convinced. Give me some more of
your numbers so that I may attempt to reproduce your results.

I need:
Bottom frequency at 30 MHz bandwidth:
Antenna impedance at this frequency:
Coax input impedance at 3/4 wave at this frequency:
Top frequency at 30 MHz bandwidth:
Antenna impedance at this frequency:
Coax input impedance at 3/4 wave at this frequency:
Bottom frequency at 34 MHz bandwidth:
Antenna impedance at this frequency:
Coax input impedance at 3/4 wave at this frequency:
Top frequency at 34 MHz bandwidth:
Antenna impedance at this frequency:
Coax input impedance at 3/4 wave at this frequency:

Frequency at which the coax was 270 degrees:
Frequency at which the coax was 360 degrees:

By the way, how did you compute SWR?

4844. Re: Is the Radio Shack TR-446 a Uniden CB?

Newsgroup: rec.radio.cb
Date: 2000-06-04 00:00:00 UTC
From: BLY <bly213@nospam.att.net>
Message-ID: <dIz_4.3128$2b4.232698@bgtnsc06-news.ops.worldnet.att.net>
Source record: 38567

I am getting responses that say that the Radio Shack TRC-446 is a Uniden and another
claiming that it is a MAXON made unit. The RS TRC-446 I have says made in
"Taiwan" on the rear of its chassis. It uses a LC3172 PLL that is said to be not
modifiable. But I just wnat to know how to peak out the audio modulation on it.
I don't care for extra channels or extra power. BTW, the ANL on this unit stinks,
but it was only $49.95 way back about 10 years ago and I did not expect much
out ot it. I still don't. But if I can use it as a kick around mobile CB for the road trips,
then that's all the I need it for.

I used to be on CB back in the early 1970's before the big CB and truckers craze hit and
drove it into a big wasteland. I don't really care for much of the garbage that I still hear out
on the band. It has not changed one bit, and actually has gotten worse around where I
am (NYC area). Mostly all foreign language spoken and whatever English is spoken, it is
all broken English or with an accent. Not that I am predjudiced or anything like that, it's
just that they pop onto the channels, key up and talk (heterodyne!) over everyone with total
disregard of anyone else using the channel. Mostly Indian/Pakistan and Spanish lingo is
heard here. It gets most annoying.
Not much that I can relate with on the band anymore these days.
I've grown way beyond that stage and just would like to have the CB for personal communications
with family and friends and for traffic and emergency reports on a long mobile trip when I need it.

Of course, even with all the nonsense on CB, I would still want to get the best equipment for
the money, so that's why I decided to get a Uniden GRANT LT modile rig. I am eyeing that
Uniden Washington Base station now. It's getting me itchy (itch, itch...). But I am trying
not to scratch it right now.

BTW, please don't jump in and tell me to get FRS and GMRS radios. I've already done that!
CB still serves a purpose that FRS and GMRS cannot. Just that you have to put

up with all the nonsense and jibberish and rude interfernce at times. That's the truth.

Bill is out.

CORRECTION folks! I mixed up the model numbers on my previous post...
Radio Shack CB TR-430 is the old rig that I was talking about... not the current
TR-446 model. Sheesh, them old burnt out brain cells of mine kicking in... uh
kicking out on me! Sorry for any confusion. Tje TRC-430 says made in Tawain
on the rear. I don't know what the current model TRC-446 says on its rear
panel.
Maybe next time I go to a shack I will have a look at it.

Bill, out!

4848. Re: Cobra SoundTracker same as Uniden Dynamic Squelch Control?

Newsgroup: rec.radio.cb
Date: 2000-06-04 00:00:00 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <393ace35@news.planetc.com>
Source record: 38571

Too bad you bought it from THE corporation, instead of a "Little Man" "Mom & Pop" CB shop. This way IF the squelch DSL is set too tight or loose, you can't have them locally set it for you, because you didn't go to the little man! Uniden doesn't put USELESS features in their CB's like RED CHINA made Cobra does. Hopefully you WILL get it tomorrow AND get WHAT you ordered (no snickering, please, those WHO know better)!!!!! ALSO don't use "good buddy" anymore. The sodomites took that term and now we use "hands" instead. Dave!!!!

BLY wrote in message ...
Well, thanks for all the good buddies who responded to clear up my question. I am glad that the Uniden "DSL" feature does not affect the transmit section audio modulation like the Cobra "SoundTracker" does. When I get my GRANT LT
from Copper's (due in the mail tomorrow!) I will check it out first hand, to see
how that
DSL really works and if it is a worthless gimmick feature or not. Thanks again!

Bill.

3's y'all.

When filling in the parameters of EZNEC I used 270 degrees
and 360 degrees to represent a odd or even multiple of a
quarter wavelength transmission line. This is totally acceptable
except.............it did not dawn on me that using a degree
parameter instead of a actual physical length would cause
EZNEC to re-compute the transmission line length for every
frequency measured within the sweep. The results of this run
(the above run) therefore would be flawed.

So I re-did the transmission line length and used 1 meter
and 3/4 meter length to represent the same transmission
line at 300mhz. With this method of trans line length EZNEC
would keep a constant trans line length as it sweeps.

The results: Both 1 meter and 3/4 meter trans lines
show the same 3:1 bandwidth. 24mhz.

There is one difference between the two sweeps. The odd
multiple line length shifts the SWR null point up in frequency.
This would cause a operator with the swr meter at the
radio to lengthen the aerial to achieve a better match
at the radio. Good or bad?.....It depends. A longer than
1/4 wave aerial actually slowly gains you gain. At the same
time the antenna is run slightly off resonance. In the end
it probably wouldn't make a difference anyway.

Conclusion? I admit the numbers show the same
bandwidth, but at the same time I know a electrical
3/4 wave trans line will out bandwidth a 1/2 wave
trans line on my vehicle. Because of this, I choose
to ignore what EZNEC and others say and continue
the use of a 3/4 trans line. I can't ignore what my
own eyes see. To each his own.

>I need:
>Bottom frequency at 30 MHz bandwidth:
>Antenna impedance at this frequency:
>Coax input impedance at 3/4 wave at this frequency:
>Top frequency at 30 MHz bandwidth:
>Antenna impedance at this frequency:
>Coax input impedance at 3/4 wave at this frequency:
>Bottom frequency at 34 MHz bandwidth:

Well, It was called the "outlaw" 8 pill shoot-out in Youngstown Ohio this weekend, It invited the biggest and the best of the 8 pill mobiles to come out and crown the king. Now this was more then the backyard BBQ shoot-out to quote one of you on this news group. some of the best on the East coast were there to fight representing Dave, 123 (in any form of his boxes) Dominator, No Name and a host of others. It all came down to the finals between Stickman (No Name) and Solid Gold 2000 (heavy hitter form the Dave Made camp). I believe that Stickman will be making a heavy deposit in his account tomorrow at the bank because the winner was paid a handsome 2,000.00 for the win. although the flier stated any antenna, they restricted the competition to 1/4 wave, this left some of the guys setting out of the competition with their 1/2 wave antenna's still in the trunk. Mr. 13 won the 2 pill class (Dave Made) Xforce won the 4 and I don't know who won in the 16. Good going Mr. NO Name (and by the way, I run all Dave Made equipment. But, as I said "give the Devil his dues" go Stickman! see Ya next time. Peewee

4859. mobile antenna for handheld??

Newsgroup: rec.radio.cb
Date: 2000-06-04 00:00:00 UTC
From: Dean Neumann <dneumann@neumann-associates.com>
Message-ID: <393ADDC5.A04018A7@neumann-associates.com>
Source record: 38582

CB'ers:

I have two handheld CB radios (GE #3-5980), which I would like to use for communication between my vehicle and any of my buddy's vehicles when we go on a multi-vehicle trip.

My handheld CBs have a rubber-duck antenna as well as an RCA-type connector for connecting them to an external antenna. We can't communicate from the handheld radios using their rubber duck antennas while driving along in our Faraday Cages.

I need options.

Option 1: I get a short, cheap mobile antenna like a 24" Firestik, and mount it to my vehicle with a hood-mount, but I would have to make a custom coax cable with a PL-259 connector on the antenna end and a RCA-type connector on the radio end. My question is, will this work or do handheld radios expect the external antenna to be a no-ground-plane system? If handheld radios expect the external antenna to be a no-ground-plane system, how do I make a PL-259 to RCA no-ground-plane cable?

Even if option 1 will work for my vehicle, the second vehicle will be different for each trip, so it cannot have a permanent mount.

Option 2: If handheld radios expect a ground-plane external antenna, can I use a mag-mount antenna, and cut the coax cable and replace the PL-259 connector with a RCA-style connector? (The cost of mag-mount antennas makes this an unattractive option).

Option 3: if handheld radios expect no-ground-plane external antennas, can I reuse the rubber duck antenna, and just mount it on a little bracket (shaped like a belt-clip) and attach it to the top edge of a partially rolled-down window, and then make a BNC to RCA coax cable to attach the antenna to the radio? I like this option because it's cheap. But if I do this would I have to add or remove connectors of different lengths to tune the rubber duck, or can I just trim the coax cable length?

The objective is to be able to mount and remove the antenna from a vehicle vehicle in seconds, cost under $20, and offer acceptable performance over a distance of a couple miles. The constraint is that it must plug into an RCA connector on a handheld unit.

Will my ideas work? Are there any better ways?
Thanks for all responses!
-- Dean.

4860. Re: Is the Radio Shack TR-446 a Uniden CB?

Newsgroup: rec.radio.cb

>uh....."
The old 430 was most likley a Uniden model, made in Tiawan, like most of
the Uniden built Cobras & Presidents of the time (I still have my original
"Tiawan" HR-2510, before they moved uniden production to the Philippenes...)!

4861. WHY you should NOT buy CB's Made in CHINA, Ms. Hicks !

Newsgroup: rec.radio.cb
Date: 2000-06-04 00:00:00 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <393ae360@news.planetc.com>
Source record: 38584

Debbie & all CB- technoGeeks:

I am quoting exactly from Congressman Zak Wamp's Statement paper in front of me as to WHY he voted against PNTR for RED CHINA:

2nd paragraph: I voted NO on Permanent Normal Trade Relations with China simply because I believe China is NOT making enough progress on human rights and basic freedoms. I am ALSO concerned that WE WILL BE EXPEDITING the Chinese MILITARY buildup by several years. The RIDICULOUS trade deficit between the US & China is $70 BILLION per year. (my comment-thanks in part to you that keep buying Cobra and other CB's that are made in China!) WE KNOW that China IS using the huge sums of $$$ it has gained in trade with the US to BUILD UP IT'S MILITARY (that's GUNS & bombs, you liberals!-my comment, and here is the "kicker"--), and China HAS ALREADY used those armed forces to THREATEN THE U.S.A. (!!!!!) As the engraved quote in front of the National Archives in Washington reads: "Eternal vigilance IS the price of freedom."
This was dated May 24th. He has a radio actuality on it @ 202-225-2244.
What I have heard is what the Chinese did is that they DIRECTLY threatened LA in saying that we like LA too much (Los Angeles) so we won't do anything against them! So when you support these jack booted THUG murderers by buying CB's made in China, you ARE actually doing what I heard Lenin say, that we are so DUMB that we will sell the rope to them to hang US with! Now whether you are a hillbilly in MO or a hi tech CB fixer in FLA, we need to STOP buying CB's and ALL other items made in China, whenever possible. And NOW it is still possible to say NO to Castro, to Clinton, to chairman Mao, to all these ANTI-CB people & forces around the world!!!!!!! Dave!!!!!!
So Debbie, please QUIT ! Also vote against ALL who voted for this treasonous legislation!!!!!

4862. LIST OF CB rigs Made In China.....

While your military paranoia is cute you are over looking the REAL reason
you
should not buy a CB made in China
Most products (Whether CBs,Nike shoes etc.) are put together by women
and
teens who work 14 hours a day 7 days a week for about 37 cents an hour.They
are
mostly housed in crowded dorms on small bunks and not allowed to go home for
up
to 6 months
The greedy company owners then charge you $125 for something which cost
them $2 to make

I hope I did`nt brain my damage.

Message-ID: <393B0974.50C47313@oio.net>
Source record: 38650

Dean,
Your radio only 'expects' to see a 50 ohm impedance at
the antenna jack. It couldn't 'care' less if it was a
groundplane, or not, if the radio 'sees' the right 'load'.
As to what antenna to use, it depends a lot on how far
apart you expect to be. If your in sight of each other,
the rubber duck should work 'ok'. Further apart, you'll
probably need some kind of antenna outside of the car. At
that point, your looking at antennas just as if you were
talking about any other mobile radio. There are adapters
that change between PL-259's and an RCA jack, no problem
there. Remember, it's always better to have 'more' antenna
than you need, than not to have 'enough' antenna when you
need it.

4878. HELP Johnson Messenger Breadbox

Newsgroup: rec.radio.cb
Date: 2000-06-04 00:00:00 UTC
From: Tinker <Speed_Buggy@hotmail.com>
Message-ID: <8hf23u$b7m$1@ins21.netins.net>
Source record: 38651

I just inherited a Johnson Messenger "breadbox" type base radio. It is the model with the A,B,C,D,E switch. My question is, Where do I hook a mic up to this radio, and does anyone know the wiring for it ? All I can find it the coax connector ,power plug, and a screw on the back that looks like a ground screw of some type.
Am I missing a hookup point ?
Thanks,
Tinker

Pirates aren't ever under FCC jurisdiction directly although they may not be able to tell the difference.
The local Federal DA is the enforcer of the Communications Act.
Transmitting on CB freqs does not require a license so part 95 is something taken with the grant of permission to do it. When you venture above or below the legal 40 you are a pirate. Running power is a violation of part 95 only within the legal 40.

The Amateur Service is licensed so FCC jurisdiction is accepted if one chooses to be licensed and Part 97 applies. If you transmit on Amateur frequencies without a license you are a pirate. If an Amateur transmits on 27.75 he is a pirate. He is also subject to having his Amateur license yanked along with any others he might hold.

I am no expert on the rules of evidence so I will take your word for it.

Many years ago a small town in Northeast Nebraska built TV repeaters to get reception into the valley where the town was located, each on its own windmill tower. Channels 4 and 9 out of Sioux City were repeated at about half a watt on beams into the valley on 13 and 2 to make them neighbors on the pre-UHF dial. Later 11 from Sioux Falls was added on Channel 6. Worked good, bothered no one.

The problem was that VHF-VHF repeaters were outlawed in 1957. So when a visitor saw the system and wrote to the FCC to get such a system for his town, he was told it was illegal and impossible; the visitor wrote back that

he had seen it and where and out the FCC came from Kansas City. So far as the town was concerned the system had been built by and was being maintained by gnomes (it was buried in the fire dept budget) and no one knew a blessed thing. Stopping by the Fed DA office in Omaha, the FCC man after explaining that it bothered no one but was illegal anyhow was escorted to the door. It ran for 30 years that I know of until cable came.

General Rule: All rules were meant to be tactfully disregarded. The key word is 'tactfully'. Every crime is some combination of rank stupidity and total lack of class. Give the impression of an intelligent gentleman of class and breeding and you can get away with nearly anything. Be a stupid clod and drunken Uncle Ole will arise staggering on Christmas and stomp the shit out of your brand new electric train. That is pretty much how it works.

Dick

Folks,

I own one of these things, and even though it's somewhat obsolete at this point, it is still a very useful VFR navigation tool. The units were selling for $999 to $1099 around five years ago, mostly due to their aviation databases and capabilities. It can communicate GPS data to a laptop computer using some of the pins on the power plug. The Garmin 295 is one of the replacements for that unit. It retails for around $1300.

>that we are so DUMB that we will sell the rope to them to hang US with!

While your military paranoia is cute you are over looking the REAL reason you should not buy a CB made in China
Most products (Whether CBs,Nike shoes etc.) are put together by women and teens who work 14 hours a day 7 days a week for about 37 cents an hour.They are mostly housed in crowded dorms on small bunks and not allowed to go home for up to 6 months
The greedy company owners then charge you $125 for something which cost them $2 to make

I hope I did`nt brain my damage.

Source record: 38660

I own a Prostar 497- a Tomahawk with a different name. I find it works excellent in all aspects. The following mods can be done to this radio (that I know of):
1.Increased Frequency Range (25.165-29.695)
2.Unlocked Clarifier
3.Power Boost (Not sure how much wattage total)
4.Talkbalk
I have the papaerwork- though smudged a bit from photocopying- on all of these. I have only had the channel mod done, as my tech informed me I was already performing 10 watts on AM, without the power mod. One thing I love about this unit is you aren't just limited to frequency display... you can choose channel display, and get a 1-40 readout, complete with "3A" labeled along with the rest of the RC's. Another nice feature is having FM, which works very well. I was going to buy a Uniden Washington, looking to replace my long-since-sold base station, but found the Tomahawk the same price at Copper. This Prostar unit I got 10$ cheaper just becuase of the name difference :)
Any other questions about this radio, I'd be happy to answer. Overall, for 169$ I'm very happy with my purchase, and I feel you will be too.

taking nothing away from Stickman, but there were only 9 competitors and i wouldnt call them
heavy hitters by any means in the 8 pill class, if he plays you the tape you will see he should
have lost after the first key in 8 pill final...As far as antennas go another bullshit deal by the club
running the break...What made the 8 pill class the "Outlaw" any different than the 2,4,16?
From what it seems all 3 amp makers won a class there.

She is not the kind of person you can take advantage of. She knew what it was worth and just wanted to get rid of it. I was going to go over and take a look at it but had worked the midshift that night and fell asleep on the couch after I came in. I snoozed I loosed. I would have given here a better offer though. Heck I would have given her $200 for the Henry Amp.

oh here we go again, who ever heard of no name before the internet
became somewhat popular. i mean really. this is so stupid, who cares
who won some silly keydown, boy , let me tell you something. when you
can win in a local situation , then you are doing something. this
keydown stuff, doesn't affect anyone about anything. get real. heck , i
heard someone the other day complaining about the skip . well you know
what? they liked it better when they could talk local. ain't that
something, ...cd is out.....

Be careful of what you get from Copper. The boards usually have similar
schematics in all of them. Most of those radios are refurbished, anyway.
Ranger, Galaxy, and Eagle are all connected. Uniden and Radio Shack are
connected. Cobra is slightly different from Uniden (but not by much).
>

Hey, What's up with Copper's that you are warning us about? I just ordered my new Uniden Grant LT with Astatic D104M6 power mic from them. Due to get it hopefully tomorrow... but now you've got me worried.

Did you mean that Copper sells all supposedly brands and units that have been refurbished as "new" units? Is that why their prices are lower than most dealers?

I hope not!

Bill,

Out.

Richard McCollum <rmccoll@radiks.net> wrote:

: Many years ago a small town in Northeast Nebraska built TV repeaters to get
: reception into the valley where the town was located, each on its own
: windmill tower. Channels 4 and 9 out of Sioux City were repeated at about
: half a watt on beams into the valley on 13 and 2 to make them neighbors on
: the pre-UHF dial. Later 11 from Sioux Falls was added on Channel 6. Worked
: good, bothered no one.

: The problem was that VHF-VHF repeaters were outlawed in 1957. So when a
: visitor saw the system and wrote to the FCC to get such a system for his
: town, he was told it was illegal and impossible; the visitor wrote back that
: he had seen it and where and out the FCC came from Kansas City. So far as
: the town was concerned the system had been built by and was being maintained
: by gnomes (it was buried in the fire dept budget) and no one knew a blessed
: thing. Stopping by the Fed DA office in Omaha, the FCC man after explaining
: that it bothered no one but was illegal anyhow was escorted to the door. It
: ran for 30 years that I know of until cable came.

It they were 1/2 watt repeaters, they were probably exempt anyway. They may
well have been entirely legal.

I believe some prople still use Diathermy for deep muscle and tissue heating. It is documented to reduce the recovery time of sprains - muscle and tissue damage.
I hear one frequently on channel 14 (The ISM Freq. for the 27Mhz band). It appears to come from a senior citizens home here in Simi Valley Ca. Many years ago when I was a kid we tea hunted one down, it was coming from a rehab physical therapy center. We went to the door and the folks.... said "Diathermy"

I personally have a RIfe/Bare Plasma Therapy machine and hear another user on the ISM Freq here locally (Also from the senior citizens home) Seems that these folks are Hip to alternative medicine.
I have a site for Rife/Bare check it out at
medicineofthefuture.com
Unfortunatly I have not had time to persue the research that a friend and I would like to do with RB therapy. Too busy doing factory automation and going through the CE process with Urine Pathology work stations.

this is what the FCC said about scanners:

FCC PREEMPTS SCANNER LAWS
FOR HAMS

The FCC has ruled that states and municipalities may not enact ordinances forbidding amateur radio equipment (mobile scanners) simply because it receives frequencies normally reserved for police use.
Conclusion: We (the FCC) hold that state and local laws, that preclude the possession in vehicles or elsewhere of amateur radio service transceivers by amateur operators merely on the basic that the special emergency, or other radio service frequencies, the reception of which is not prohibited by federal law are inconsistent with the federal objectives of facilitating and promoting the amateur radio service and, more fundamentally, with the federal interest in amateur operators being able to transmit and receive on authorized amateur service frequencies. We therefore hold that such state and local laws are preempted by federal law.
The FCCs ruling follows a five year effort by ARRL to obtain a definitive ruling after several highly publicized cases where Amateur Radio operators ere subject to arrest and seizure of mobile amateur radio equipment by local authorities for violation of so-called scanner laws
(Summarized from W5YI REPORT, Sept. 15, 1993

Almost 60 reasons why its great to be a man!

1) Your ass is never a factor in a job interview.
2) Your orgasms are real. Always.
3) Your last name stays put.
4) The garage is all yours.
5) Wedding plans take care of themselves.
6) You don't have to curl up next to a hairy ass every night.
7) Chocolate is just another snack.
8) You can be president.
9) You can wear a white shirt to a water park.
10) Foreplay is optional.
11) You never feel compelled to stop a friend from getting laid.
12) Car mechanics tell you the truth.
13) You don't give a rat's ass if someone notices your new haircut.
14) The world is your urinal.
15) Hot wax never comes near your pubic area.
16) You never have to drive to another gas station because this one's just too icky.
17) Same work ... more pay.
18) Wrinkles add character.
19) You don't have to leave the room to make emergency crotch adjustments.
20) Wedding Dress $2000; Tux rental $100.
21) If you retain water, it's in a canteen.
22) People never glance at your chest when you're talking to them.
23) The occasional well-rendered belch is practically expected.
24) New shoes don't cut, blister, or mangle your feet.
25) Porn movies are designed with you in mind.
26) Not liking a person does not preclude having great sex with them.
27) Your pals can be trusted never to trap you with "So, notice anything different?"
28) One mood, ALL the damn time.
29) And don't forget..... Phone Conversations are over in 30 seconds flat.
30) You know stuff about tanks.
31) A five-day vacation requires only one suitcase.
32) You can open all your own jars.
33) Dry cleaners and hair cutters don't rob you blind.
34) You can go to a public toilet without a support group.
35) You can leave the motel bed unmade.
36) You can kill your own food.
37) You get extra credit for the slightest act of thoughtfulness.
38) If someone forgets to invite you to something, he or she can still

be
your friend.
39) Your underwear is $10 for a three-pack.
40) If you are 34 and single, nobody notices.
41) Everything on your face stays its original colour.
42) You can quietly enjoy a car ride from the passenger's seat.
43) Three pairs of shoes are more than enough.
44) You don't have to clean your apartment if the meter reader is
coming.
45) You can quietly watch a game with your buddy for hours without ever
thinking "He must be mad at me."
46) No maxi-pads.
47) You don't mooch off other's desserts.
48) You can drop by to see a friend without having to bring a little
gift.
49) If another guy shows up at the party in the same outfit, you just
might
become lifelong friends.
50) You are not expected to know the names of more than five colours.
51) You don't have to stop and think of which way to turn a nut on a
bolt.
52) You almost never have strap problems in public.
53) You are unable to see wrinkles in your clothes.
54) The same hairstyle lasts for years, maybe decades.
55) You don't have to shave below your neck.
56) Your belly usually hides your big hips.
57) One wallet and one pair of shoes, one colour, all seasons.
58) You can "do" your nails with a pocketknife.
59) You have freedom of choice concerning growing a mustache.
60) Christmas shopping can be accomplished for 25 relatives, on December
24th, in 45 minutes.

This is NOT propaganda--it is FACT. Yes, I am trying to suppress your alleged "freedom of choice" by educating you to NOT buy that Chinese JUNK! Now IF you want to be STUPID and fund the people that want to bomb LA, then on the CB they tell you what to do---"Shut up stupid!" You are the fool for saying that I am a fool for exposing this stuff. I will preach CB truth to the end, and other truths, because I am commanded to (Isa. 58).
Dave!!!!

Dave or Debbie,

Take your propaganda to an appropriate newgroup! Don't people have the right to buy what ever they want? Aren't you trying to suppress peoples freedom of choice? I may or may not agree with what is going on in China but I am in this NG to talk and learn about CB Radios not sway people's opinions.

Your opinions are valid but stop preaching them the NG. You are making a fool of yourself.

Barry D.

Oh boy, here we go... If "messing with Christians" makes you an enemy of God, then half the Christians I know are enemies of God. It's the only army that shoots its own.

I'm a devout Christian, and am aware of atrocities committed against Christians, not only in China, but also in plenty of other countries (including the USA). You can't single out China on this one -- it happens everywhere.

I'm assuming you consider yourself a Christian, Dave. Don't the teachings of Christ explain to us that it is better to love one's fellow man than to speak slander against them? If someone consistently referred to me as a red commie, I certainly wouldn't mistake that for love, or even respect.

For those that care....here is a list of known CB & "export" rigs made in
RED CHINA, feel free to add to the list:

All "nothstar" brand shitty radios
Cobra 25 & 29's, & some newer 148's
"Emperor Ts-5010 & 3010 radios
CHEROKEE "Nightrider" CB radios & CBS-2100 base
Many of Radio Shack's crappy mobiles

>
> KRS

You don't need three-phase as such but you do need one hell of a lot of DC. I started broadcast engineering in my college days and my first transmitter was a Gates 5kw FM transmitter using a 4CX5000 running about 5500 volts at about 1.1 amps. The power supply (and this is steady carrier FM mind you) had three-phase 480 volt primaries and a six pack of the old 866 mercury-vapor rectifiers glowing away.

The final and its hardware for tuning and coupling to the nitrogen-filled coax was in a rack all by itself. The last time I looked, 5kw on 50 ohms was about 10 rf amps which is not exactly what RadioScrap RG8 was designed for.

I am a great fan of paper designing myself but do you have the slightest idea what it takes to support one of these beasts? Just the tube -- not to mention the associated socket, chimney, etc. -- will cost you enough. Now build the power supply and the antenna structure complete with positive-pressure gas coax (the gas truck will certainly interest the neighbors). I am awaiting your plate tank design with great interest; do you plan to drill holes in the floor for the 18 foot tuning strips, find a tuning cap or two with 25kv insulation, or broadband it with the world's largest matching transformer?

Oh, you are going to use it on SSB. Any good thoughts on where to find a 200 uf output filter cap with a 10 kv rating??? And the list goes on (and on, and on). It is just a bit early in the game to be asking which is 'preferred'. I would personally use the tetrode in spite of having to design something that would cut down the input if the screen supply failed -- I don't like buying tubes for no good reason. Tetrodes are generally easier to drive and are a lot less skittish than triodes but they each have their place.

If I had the time and money to pull this caper off it would be 38th on my list of six 'to-do's' today.

Dick

4928. You Might Be A Radio Nut IF.....

Newsgroup: rec.radio.cb
Date: 2000-06-05 00:00:00 UTC
From: TW <tandb80@home.com>
Message-ID: <BWW_4.6186$r7.1360744@news1.rdc2.tx.home.com>
Source record: 38701

Hi, saw this in the recent Pop. Comm. Very funny. Read on.

Top 29: You Can Tell You're A Radio Nut...

1. You remember the exact date and time that lightning hit "the tower". And the whole radio room was burned to a crisp, but you tell friends, "at least my wife wasn't home when it happened."
2. You'll spend hundreds of dollars on a new rig, and then wander the hamfest pausing each time you pass the booth selling those $7 embroidered hats. "I wonder if they'll take $6?"
3. You're a CBer who buys a new $300 five-watt, perfectly operating rig, opens the cabinet to "tweak" it to 20 watts, knowing full well it'll end up being sent back to the company for repair. The radio comes back, and a few weeks later you repeat the process -by watching your CBer friend from across town do surgery on your radio.
4. When shopping for a new vehicle, you somehow end up sitting in the front seat staring blankly at the dashboard area, feeling underneath seats, and poking around the backseat for ways to mount the radio and route the coax. If caught looking under the hood for holes in the fire-wall for your power cables, you tell your wife, "Nothing honey, just checking the connections under here."
5. Your family has a special annual garage sale just to get rid of the boxes of wire, coax, and power adapters-but you pay your friends to "buy" the stuff and get them to return it to you the following weekend.
6. You absolutely need a radio with thousands of channels-even though you live in a town with three cops and a volunteer fire department and the airport is 350 miles away.
7. In your determination to get that new vertical antenna up, or longwire strung in the backyard, you tell family and neighbors that "it's only temporary -I'm testing it for this guy."
8. The $10 bargain you got at the fleamarket that smoked up the whole hose when you turned it on is one of your prized possessions.
9. You'd rather sell your family's TV and VCR than give up the box of vacuum tubes you got at a "bargain" even though 90% of them are dead.
10. It still doesn't matter to you if the antique radio you brought home was an apartment for mice.
11. You're not speaking to your elderly neighbor because last week just as you tuned Radio Kiribati, he turned on his power drill.
12. Your wife has called you three times for dinner-the FOURTH could be a call from her lawyer.
13. You're the only one in your family that understands the real meaning of CW. And you get stressed out if someone's CW transmission rate varies from one to 75wpm with no warning.
14. When going on vacation, the first thing you think about packing is your scanner and frequency book.

15. You take your scanner to work disguised as a cell phone.
16. You acknowledge conversations with your family and friends by saying 10-4- and they think it's normal.
17. The total number of radio related books in your home are five times the number of other books and magazines.
18. You store extra "emergency" AA batteries in the refrigerator.
19. You're immediately recognized and spoken to by name at your favorite radio dealer.
20. You think a good time is "breaking in" a new part-time Radio Shack employee with your radio wisdom.
21. Your spouse goes to the supermarket while you "look around" in Radio Shack.
22. You visually check your outdoor antennas and coax once a week, regardless of the weather.
23. People ask you to turn down the volume on the radios when they call you.
24. The total number of antennas on your house is greater than six other houses on your block-counting the ham down the street.
25. You've considered contacting NOAA offering your voice as a substitute for that awful sounding mechanical computer-generated voice.
26. People keep asking your family about the "light that's always on" in the back room where your radio shack is located.
27. More than 95% of the photos in your family album show you with a radio strapped to your belt or a microphone in your hand.
28. You have more certificates and licenses on the wall than your local veterinarian or dentist.
29. Your cat or dog instinctively knows not to bother you when you're in your radio shack.

Pretty funny huh?

Endless, Nameless wrote:
>
> Anyone know if a 6j36 sweep tube can be switched to a 6lq6 without
> modifications?

Yes, they are interchangeable. The 6JE6A is a slightly
lower power (plate dissipation) version of the 6JE6C,
which is the same as a 6LQ6 as far as sweep tube amps
are concerned.

> I have a friend that has a small single tube amp,
> seemingly the same as mine just a different face plate, and he gets 150
> watts out on a Bird with a 6lq6.

That's a false reading. No single sweep tube can
make 150 average watts. I'm assuming you're using
a plain, old Bird 43 (not a peak-reader).

> Mine is a single 6j36(A if that
> helps) and I only see about 50 on it.

50 average watts translates into about 150 peak watts.
150 peak watts from a single sweep tube in a mobile
tube amp (where the plate voltage is 600-650 instead
of 800) is about right. If you're reading peak wattage,
your friend's amp is working right and yours most likely
has a soft (worn to the point where it won't produce
full power anymore) tube in it.

> Is the tube bad or is this all I
> can expect out of it?

It depends. I use peak readings rather than average
readings to evaluate amplifiers. To get a rough
peak reading using a Bird 43, measure the fully
modulated wattage and multiply it by 3 (actually
it's supposed to be 2.828, but 3 is close enough).

Hopefully, your amp will hold that 50 watt reading
at full modulation. That would mean it's doing
about 150 peak (assuming a normal, symmetrical input
waveform) and is functioning properly.

Your friends amp could be dead keying way too high
and/or fooling the meter with its harmonic and/or
parasitic content. It's not impossible to fool a
Bird. A better test would be to test both amps

with the same antenna and compare field strength
readings rather than forward power readings. If
his amp is dirtier than yours, the antenna will
act as something of a filter (since it's a tuned
circuit), and the field strength readings will
more accurately report the actual in-band power.
Under those conditions you may find that your
amp is the better performer.

> thanks.

You're welcome.

I agree.

> He would have to be running at like 300 watts plate input power...around 350
> ma at 800 volts, a 6LQ6 would be glowing red at 800 VDC.

It's not the 800 volts, it's the 350 mA of plate
current that would make the plate glow and quickly
destroy the tube.

The only way to get 150 average watts out of one
sweep tube is to drive it with 100 watts (since
it's running in grounded grid and the drive power
feeds through and shows up in the output). Even
at that, the result would be an overdriven, satu-
rated, backswinging, crappy sound.

If one of those methods uses a 211-07 case device like the MRF455
or the SD1446, there may be a few interested parties out here.
You (the guy who posted this spam) should include that in your
ad. Dropping the price to say $2.50 might help too since what
you're selling is available for free on the web (excluding an
in-depth treatment of the use of a 211-07 device).

FS: Uniden HR2600 w/chipswitch 10/11/12 Meters

Like very good condition. Chipswitch adds features to radio...like memory
etc.
For details see http://www.chipswitch.com.

Comes with manual, Mike and power cable.

$200 delivered to your door.

--

Thanks,
Alex

Email: alexjent@prodigy.net

For those that care....here is a list of known CB & "export" rigs made in
RED CHINA, feel free to add to the list:

All "nothstar" brand shitty radios
Cobra 25 & 29's, & some newer 148's
"Emperor Ts-5010 & 3010 radios
CHEROKEE "Nightrider" CB radios & CBS-2100 base
Many of Radio Shack's crappy mobiles

4939. Re: WHY you should NOT buy CB's Made in CHINA, Ms. Hicks !

If it were true that you were a RED commie, it would be LOVE to tell you to repent. Jesus said that IF you love him, keep HIS commandments. The problem is that we have alleged "christians" that practice Marx's 10 planks of his manifesto, rather than the 10 Commandments of God! It is very possible that half the "christians" you know ARE the enemies of God. WHO does 2 Chron. 7:14 apply to? State churched "christians" who don't keep God's commandments, and therefore don't Love him. If I love you, I tell you the truth. Are you accusing ME of slander? Come to me directly, like the Bible teaches and tell me what you have against me. Write me @ truth@planetc.com . If not, you are a false witness or a false accuser. And we KNOW who the main accuser of the bretherin is, right? More below in your post, double spaces to see easier below each point.
Dave

> also, therefore GOD is against them!!!
> Dave!!!!!

Oh boy, here we go... If "messing with Christians" makes you an enemy of God, then half the Christians I know are enemies of God. It's the only army that shoots its own.

That's right, IF a government "messes" with Christians, then they are messing with the apple of God's eye. Then God HATES them and WILL bring judgment to them, BIG TIME.

I'm a devout Christian, and am aware of atrocities committed against Christians, not only in China, but also in plenty of other countries (including the USA). You can't single out China on this one -- it happens everywhere.

I know it happens everywhere, but the SUBJECT of this POST is to single out these commie murderous threatening bullies so I can inform others as to NO SUPPORT them any more. DO you have a problem with that?

I'm assuming you consider yourself a Christian, Dave. Don't the teachings of Christ explain to us that it is better to love one's fellow

What is the Biblical definition of Love? It ain't mushy--it's keeping HIS commandments.

man than to speak slander against them? If someone consistently referred to me as a red commie, I certainly wouldn't mistake that for love, or

even respect.

It would be love IF I wanted you to repent. If I
wanted you to keep on in your communism then I would say Nothing and do the
opposite of Isa. 58.

No, I don't tell them to take a hike. I inform them of WHY it broke down (Made in China) and I fix it. I inform to take $$$$ out of future sales to China and have people buy Phillipino CB's instead! And IT AIN'T nearly all of them yet! There are still many CB's made in other countries other than China, the Phillipines being the highest quality now. I personally am probably responsible for diverting thousands of $$$$ away from China, to the Phillipines instead, which makes a HAPPIER customer!!!!! Now is this bad business, sunny?
Dave!!!!!

I was wondering at what frequency(-ies) the lines were 270 and
360 degrees. These are results I would expect.

> There is one difference between the two sweeps. The odd
> multiple line length shifts the SWR null point up in frequency.

I don't buy this. There is no shifting of the frequency of
minimum SWR. Something is wrong in your calculations.

If the minimum SWR is shifting, then you are saying that the
coax is changing the SWR -- which simply doesn't happen
(in a lossless transmission line which I presume your model
is using).

Since I didn't get the other numbers I requested, at least
give me this much. Just pick one frequency where the SWR
changes and give me:
- the frequency
- the antenna impedance at that frequency
- the frequency at which the coax is 3/4 or 1 wavelength

Let me run the calculations and see where they disagree
(I already know they will disagree).

> This would cause a operator with the swr meter at the
> radio to lengthen the aerial to achieve a better match
> at the radio.

No. This won't happen.

> Conclusion? I admit the numbers show the same
> bandwidth, but at the same time I know a electrical
> 3/4 wave trans line will out bandwidth a 1/2 wave
> trans line on my vehicle.

No. It just isn't true.

> Because of this, I choose
> to ignore what EZNEC and others say and continue
> the use of a 3/4 trans line. I can't ignore what my
> own eyes see. To each his own.

Well, a longer transmission line (which requires no particular relationship to wavelength) will display a broader SWR bandwidth by virtue of the extra loss. Less reflected signal makes it back to the radio so the SWR reading is lower but performance is actually worse. This could explain what you have seen.

Don't ignore the theoretical calculations. This is what prolongs myths about coax lengths. You need to pursue it and reconcile the differences to understand the reality of the situation. Give me the numbers I requested and we can better understand this issue.

Message-ID: <sjno8iiv5ri141@corp.supernews.com>
Source record: 38804

I thought I would order a couple MRF 477 transistors for my 1998 model President Lincoln. The 2 places I normally order from are sold out. Anyone out there have a couple they are willing to sell?

I have also considered doing the 497 power mod, but haven't built up the courage yet.

Also, the newer ones are using the 455, which is a 60 watt verses the 40 watt 477. Is this a direct replacement other than the normal procedure of replacing a final?

Dave

Merry Christmas , you won 1 class at a keydown... does that mean you are the baddest around??
what happened in the other classes that you lost in ? Can you name the heavy hitters that were there? Was BB there ? Was mr.Gunn there? Was Concrete man there? Was 123 there ? Was Heavy Chevy there? Was HoundDog there Was 217 there? Was the NY Crew there ? please you deserve credit for winning the class but Nothing more otherwise you still are mudducks and ya'll better keep going to DaveMade to buy your parts and regulators that you guys cannot build ... Talk about mudducks You had better check the tape of the 8 pill final see who made the tape and who did not..

<rest deleted>

Almost all handheld CB's use a BNC connector for the rubber-duck antenna. The simpliest way to connect a moble antenna is remove the rubber-duck antenna and connect the external mobile antenna to the handheld CB using a BNC connector. There are PL-239 to BNC adapters available to make the task easier.

There might be a conversion chart on the Bird or Coaxial Dynamics
websites. If not, an e-mail to either company's tech support
department should net you one.

If you don't even want to go that far, you can do the math
yourself. In most cases you can do it in your head while
you're doing your antenna tuning. SWR is just a ratio of
the power being absorbed and (hopefully) radiated by the
antenna to the power being reflected back toward the radio.
Dividing the reflected figure by the forward figure gives
you a reflected power percentage. A 3:1 SWR equals a 25%
reflected power percentage. If all you're running is a
stock CB or other bone stock radio (an export, 10 meter rig,
or HF ham rig), a reflected power percentage of up to 25%
is acceptable. If you're running an amplifier or a hopped-up
radio, it's best if you shoot for as low a reflected power
percentage as possible--say 5% or less--unless the unit
has built-in SWR and/or thermal protection. The same goes for
modern HF ham rigs that protect themselves by lowering their out-
put power when an SWR of more than 2:1 (11% reflected) is
detected. These days most of the equipment is solid-state;
that means it's more sensitive to high levels of reflected
power, and, you'll very likely obtain better overall results
if you put forth the effort required to obtain both maximum
forward power (make sure the transmitter is developing full
power with the antenna as a load) and a reflected power per-
centage of 5% or less.

Good luck and have fun.

> Chicago, Il.

There are a couple of 3-pin regulators attached to
the side of the main chassis; make sure the solder
joints are solid. Since the regulators are attached
to the frame but soldered to the board, it's common
for the solder joints to crack when the radio is
used as a mobile, handled roughly, dropped, etc.

As for service info, you can go straight to Ranger
in Southern California or to the RCI website. If
you go to Ranger directly, have the serial number
of the radio handy since there have been revisions
made in the 12 years that the 2950 has been in
production. You'll want the service manual that
corresponds to your specific unit since the symptoms
you describe could be in the CPU and display sections.
Those sections are where most of the design changes
have been made.

4964. Re: Groundplanes - How to design them ?

Newsgroup: rec.radio.cb
Date: 2000-06-05 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <TAT_4.6327$qS3.16301@tor-nn1.netcom.ca>
Source record: 38817

Sorry, one more question.

If I were to leave the ground planes flat (i.e. unbent) and used an antenna matcher, would that give the same result (or similar) as having them bent at 45 degrees ? Or is it better to lower the SWR as far as possible by physically adjusting the antenna and groundplane, and then perhaps using a matcher ?

The reason I ask, is that a 108" leg at a 45 degree angle produces a vertical height of 76.3" (if my trigonometry is correct). Add a 102" whip antenna on top, and I would have an overall height of 178" or so. I know that this would not fit in my loft, unless I use a 2 foot Firestik on the top ! (I am going to go up there and check what headroom I have).

Richard.

Two points in the external speaker jack have to make contact for sound to come out of the speaker. If that connection becomes resistive the speaker volume will decrease or go away altogether.

The best solution is the use of an external speaker since it also has other advantages over the internal speaker as well as solving the problem you're having now.

Another trick you can use to get more life out of the external speaker jack (since it's a pain-in-the-ass to replace) is to bend the rearmost contact that is visible with the bottom (speaker side) cover removed down (toward the top of the radio).

Here's that trick in detail:

Remove the speaker side cover and locate the external speaker jack. Position the radio so that it is upside down with the knobs facing you.

Inside the radio where the external speaker jack is located, on the part of the jack that is closest to the front of the radio (the rearmost part of the jack itself), you'll see a piece of metal going straight across the jack from side to side.

Your job is to use a tool to bend that piece of metal down (toward the top of the radio). That will increase the spring tension on the contact below the one you bent. The contact below the one you bent loses it's spring tension when an external speaker is plugged in for long periods of time (or short periods of time each day for a number of years).

If you find that the external speaker jack or the internal speaker and/or its wiring and main board plug isn't the problem, there is another mod I know of that might solve the problem. The symptom that points to the other mod is that you occassionally need to turn the radio off and on several times before you can hear anything. However, from the symptom you describe, it doesn't sound like the mod I have in mind will solve your problem. Faulty external speaker jacks are much more common--especially in radios that have been in service for a number of years. Take a look at the first digit of the serial number. If it's below 7, the radio is already a couple of years old or more. In daily use, those cheap, little jacks are lucky to last more than a couple of years.

A final note:

Be careful when bending the contact mentioned above.
Only bend it enough to get the job done. You may also
want to spray some contact cleaner and lubricant between
the two contacts before doing any bending.

Of course there is a chance that the jack is just so
worn out that cleaning and bending won't fix it. In
that case I recommend replacing it with an outside
jack. In other words, run two wires (or a thin shielded
wire like mic wire or RG174) from the external speaker
solder pads out through the hole in the rear of the
chassis and into a good quality 1/8 inch (or even 1/4
inch if you want even heavier duty) mono jack and use
an external speaker wired to match.

I hope this helps.

>
> I have an rci 2950 but it is locked on 26.000mhz any ideas how to
> unlock? and where is the reset button maybe you could point me in the
> direction of a wiring diagram for it!!

The new ones don't have a reset button or a memory
battery (serial numbers with a first digit of 4 or
higher). Supposedly, (this is out of the mouth of
a tech at Ranger) the new ones perform a "soft"
reset whenever they are cycled on and off. In other
words, to reset them you simply turn them on and
off a few times. To do a hard reset you need to
diconnect it from any power source until the capacitor
that supplies the CPU in order to maintain the memory
information discharges. Then, the next time it powers
up, the CPU will have reverted to its defaults.

The older ones (first serial number digit of 3 or
lower) have a memory battery and solder pads for
a reset button. If yours is one of those, make
sure the memory battery's solder joints are solid
and that the memory battery voltage is at least 3
with the radio off and disconnected from DC power.
As for the reset button; in all but the very first
ones, the button is gone but the solder pads and the
switch symbol and designator are on the control board.
The control board is the vertical board where all
the modification jumpers are located. If you look
at that board you'll see the painted on switch symbol,
part number, and the two solder pads. To reset the
CPU, briefly short those solder pads together with
a short piece of wire while turning the radio on.

Wiring diagrams can be obtained from Ranger in
Southern California, from the RCI-web website,
and (I believe) from Lou Franklin.

I hope this helps.

I just installed a whip antenna on the side of my jeep and thought that I had it all hooked up properly. Went to turn on my radio and all I can do is receive. For some reason the thing does not transmit at all. I have tried it on the highway, and every where else you could think. But still nothing. The radio is only a year old, so I do not think that is it. Any help would be great.

I put a post on here a week or so ago looking for a manual for a radio I want to refurbish.

Brad Thompson, AA1IP was one of several that responded. His service was quick, the item was received packed like it was going to go thru a warzone in tact, and was in better that advertized condition. There were NO hidden fees. The quoted price and shipping were exactly what he quoted me.

I would recommend his service to anyone and intend to use him again if the need arises.

Anyone know if a 6j36 sweep tube can be switched to a 6lq6 without modifications? I have a friend that has a small single tube amp, seemingly the same as mine just a different face plate, and he gets 150 watts out on a Bird with a 6lq6. Mine is a single 6j36(A if that helps) and I only see about 50 on it. Is the tube bad or is this all I can expect out of it? thanks.

4981. Re: 3CX vs 4CX tube

Newsgroup: rec.radio.cb
Date: 2000-06-05 00:00:00 UTC
From: timnebo@aol.common
Message-ID: <20000605174639.15681.00000681@ng-cp1.aol.com>
Source record: 38834

hi richard. here is a answer from a authority on running big tubes on 11 meters
which you seem to think is impossible. its in response to your last message.

****

I no longer have internet access, so please feel free to post this from
me...

This asshole deserves to be ripped on :)

> >>
> >> So what is the preferred tube? Do you need 3 phase power to run 4CX
tube?
> >>
> >> KRS

>>>Kris,

If you can get a good designer, the 4CX tubes are easier to drive in tetrode
configuration, and
the 4CX5K on up provide near or better than 20dB gain.. Meaning, I see
about 20Kw output
for 200 watts of input on my 4CX5000.

> >
> >You don't need three-phase as such but you do need one hell of a lot of
DC.

How the hell do you suppose your going to get the power? To get DC output
from
a AC source, you have to have a hell of a lot of AC input to the
transformer. This
comment alone proves that your nothing but a troll and a dolt... Or someone
who
prescribes to "old school" (read that as "I have been out of RF for so long
that I
have no idea what I am talking about" theories)

> >I started broadcast engineering in my college days and my first
transmitter
> >was a Gates 5kw FM transmitter using a 4CX5000 running about 5500 volts
at
> >about 1.1 amps.

So let's take a good look. Your running about 6Kw of input, and at 70
percent efficiency
(since the 4CX5K is only rated at 5Kw of diss. in class C, 6Kw class AB) you

see a little
more than 4Kw output. Pretty shitty for a tube that Eimac rates (and
Collins gets) 15Kw
in Class C FM.

> >The power supply (and this is steady carrier FM mind you)

Yes, steady carrier. Means that the power supply needs little to no
dynamic regulation. It is a static load on the transformer, filter cap and
associated power supply components.

> >had three-phase 480 volt primaries and a six pack of the old 866
> >mercury-vapor rectifiers glowing away.

How many primaries did it require?

Wait.. Look at this! You can get a pole pig transformer, run it in
reverse,
and get near 5500 VAC at 5+ amps! This just happens to be the same
transformer that the power company uses to drop the AC into your house!
Could it be? Yes, it COULD! You don't need 3 phase! And YES! The
power company CAN, AND DOES make 50 and 100 amp drops to radio
rooms for amateurs and CBers, as long as your willing to pay!

> >
> >The final and its hardware for tuning and coupling to the nitrogen-filled
> >coax was in a rack all by itself.

So, IOW, if we put it in plain text, that the average CBer would understand,
you
didn't use a Pi network? You used either stripline, or a cavity (probably
the cavity).

Since this is at 100++ megs, I would venture the cavity would be the proper
way to go.

Hey, guess what? I had a Collins 208U-10 10Kw PEP output (from a single
4CX10K
driven by a pair of 4CX250Fs, 200 mW in, 10Kw out) that was running on
220VAC single
phase... You gonna tell me Collins was a bunch of idiots now? DOubtful.

The last time I looked, 5kw on 50 ohms
> >was about 10 rf amps which is not exactly what RadioScrap RG8 was
designed
> >for.
> >

No, it isn't. However, I have run my 4CX5K with 150 watts of drive, and 5Kv
on the plate SSB
into rg-213. Hardline works even better. However, if using Hardline, you
need at least a small
run of 213 or LMR to the beam, for flexibility.

> >I am a great fan of paper designing myself but do you have the slightest
> >idea what it takes to support one of these beasts?

Yes. I build these amps. I don't do paper design. I do the actual
building of
both Class C and Class AB RF amplifiers.

Just the tube -- not to
> >mention the associated socket, chimney, etc. -- will cost you enough.

Tube app 400 dollars from Econco (rebuilt)
Socket app 300 dollars EBay (or TRW Swap-Fest, from where KRS lives :))
Tranformer 600 dollars, if he chooses to get new from PWDahl.
Vacuum caps (2 needed) about 50 dollars a piece (E-Bay and TRW)
Plate tank coil 5 dollars (wound from copper ice maker tubing)
Filter cap for power supply less than a hundred bux.. Fair is having a sale
on 5Kv 33 mF caps.

The rest of the shit can be gotten from any ham user, or any high power
CBer.

Now
> >build the power supply and the antenna structure complete with
> >positive-pressure gas coax (the gas truck will certainly interest the
> >neighbors).

What the fuck are you talking about? Andrews Heliax or Hardline works fine,
and I have run a pair
of 4CX15000s into them (well, set the system up). This was at over 50Kw AVG
power out, 100Kw ++ PEP.

Ran off (you guess it!) 44 3phase in a commercial environment.

Once again, your showing your age, mi amigo.

I am awaiting your plate tank design with great interest; do
> >you plan to drill holes in the floor for the 18 foot tuning strips,

At HF, we don't use stripline, moron. At HF you would use a 10 to 400 Pf 10
Kv Jennings vacuum cap,
a 25Kv 1000pF blocking cap, about 5 turns of 3/8 to 1/2" diameter tubing for
the plate circuit and a 100 to 1000
5Kv ant tune jennings.

find a
> >tuning cap or two with 25kv insulation,

Not needed if you use a good plate blocking cap.

or broadband it with the world's
> >largest matching transformer?

That is commonly done with Aphas and Command Technologies amateur legal
limit amps, to
get good 80 and 160 coverage at 2500 watts. They use large core stock.

> >
> >Oh, you are going to use it on SSB. Any good thoughts on where to find a
> >200 uf output filter cap with a 10 kv rating???

What? At 5 amps, you need more like 30 to 60 uF at 9kV. WAY less if you use choke
input.

And the list goes on (and
> >on, and on).

Nope. I can build a RF deck for about a thousand dollars, if I look hard enough.

If the CBer wants to drive the piss out of it, I still use a tetrode, but connect the grid and
screen together, and let them drive the cathode / filament. This give one HELL of a triode,
and results in 18 grand out of a 4CX5K on a stiff base power supply.

It is just a bit early in the game to be asking which is
> >'preferred'. I would personally use the tetrode in spite of having to
> >design something that would cut down the input if the screen supply
> >failed --

>>>Why? Use a small transformer that has a core that saturates at 10 percent greater current
draw than design. This limits screen current in the event of plate power supply failure. Ditto for the fils
transformer. No more inrush current resistors are needed then.

I don't like buying tubes for no good reason. Tetrodes are
> >generally easier to drive

Yes, your right.

> >and are a lot less skittish than triodes

That is pure bullshit. A tetrode (by the nature of the beast) is harder to tame than a triode, due to
the higher gain at VHF and above. Almost all tetrodes require neutralization, and VHF suppression
in both the anode and grid department. Triodes never have the amount of gain for same-dissipation
figures. Especially at VHF. Your comment was TOTALLY off.

I hope your old professor doesn't read this group.. He would be dying of laughter.

> >but they
> >each have their place.

> replacing a final?
>
> Dave

There are places around that still have 477s although
they'll want at least $25 each for them. Ralph at
D&R Electronics (rted821836@aol.com) is an example.

Personally, I like the 455. The problem is mounting
it since it's a 211-07 case device which is way way
different from the 477 which is a TO-220 case device.
I don't know how Uniden pulls it off. (If someone
who reads this has a new Lincoln and a digital camera,
I'd appreciate it if you'd e-mail me a picture or two
of the final RF amp area where the 455 is mounted).

There's an old mod I know of that's been around almost
ever since the 2510 came out that uses the 455. The
original idea was to use the 455 to prevent overdrive
when the ALC (SSB modulation limiter) is defeated.
Electrically, the 455 and 477 are compatable. In other
words, there is nothing special electrically that you
have to do to use a 455 in place of a 477. On the
other hand, mechanically, you have to do some custom
work. The mod I have shows the 455 mounted to a 1 inch
by 2 inch piece of 1/16 inch thick aluminum. Then, the
aluminum part with the transistor mounted to it is
attached to the chassis heat sink. And finally, the
new transistor is hard-wired in place of the 477 using
short pieces of hook-up wire.

I've never done the mod personally. I don't see why the
455 can't be mounted directly to the chassis heatsink or
even one of the tin lids for that matter. I know for a

fact that a tin lid can sink enough heat for a normally operated 455. The leads have to be kept as short as possible, and the area of the lid where the transistor is mounted needs to be prepared by sanding off the rust preventing coating. After the coating is gone, using fine (220 grit or higher) sandpaper to polish the spot helps too. Then it's just a matter of using a thin film of good quality heat sink compound when mounting the transistor. Other tips include: using good quality hardware (including star washers) to mount the transistor, not over-tightening the mounting screws (5 inch-pounds is the Motorola torque spec.), using a low-gain transistor (DC Beta of 20-40) for increased stability, and adding a negative feedback loop (a .1 uF, 25 volt disc cap and a 33 ohm, 2 watt carbon resistor connected between the collector and base) to increase stability and decrease distortion.

As the price of the 477s and 497s goes through the roof, this type of mod will become more and more popular. Any do-it-yourselfers that have 2510 style radios should save this for when the time comes that your radio eats a final.

I'm not a big fan of the 477 and 497. It's not uncommon to see peak wattages of 40 from a 477 and 50+ out of a 497 running in one of those radios when the ALC is defeated. In my opinion, that's too much for reliable operation of TO-220 case devices. Combine the high output power with the fact that the SSB waveform with the ALC defeated is of a lot higher duty cycle (looks more like a carrier than sideways Christmas trees) and no SWR protection, and you've got a recipe for repeated device failure. The 455 is a much heartier device that's cruising happily at 40-50 peak watts even when the SWR is high and the heatsink isn't ideal. In other words, even with a half-ass installation job it'll probably still outlast the rest of the radio.

I hope this helps. Good luck.

That's not true.

I post a link to it roughly once a month and whenever I
see a post where someone asks about it. My signature
also includes a link to it. Since I'm a regular here,
there's almost always a post of mine floating around
that can be used to gain access to the FAQ.

Personally, I believe that posting the actual FAQ here
is a waste of bandwidth... Anyone that can access a
newsgroup can access a website.

I'll post the whole damn thing once a month if that's
what people want. I just feel that if it came to a vote
there would be more "don't post it here" votes than
"do post it here" votes. I feel that the way I handle
it is the best approach.

The bottom line is that the FAQ for this newsgroup is
alive and well and maintained by at least 2 people:
myself and Andy Cody. And it's not hard to find in my
opinion.

I believe he meant 3 phase in a mobile appliation. I could be wrong. But
the answer to that would be yes.

Source record: 38841

Pardon, but how did you determine that it wasn't transmitting? Actually check the field strength near the antenna, or assume that it isn't working because nobody responded to you? Despite the age of the radio, it could be dead, or there might be a problem in the antenna system. I would start by keying the radio through a watt/swr meter into a known 50 ohm load--dumby load or flat swr antenna. If at that point there is no output, that pretty well limits the problem to the radio. If it is alright, then take a look at the swr exhibited by the antenna you are trying to use. Likely the problem is quite simple--they usually are.

I would agree that you get what you pay for. All the radios are close to the same output specs when they come out of the box, but various radios have different bells and whistles. If you are attempting to get out beyond the neighborhood, find a radio which sports both AM and SSB. This will cost more. The antenna you choose is MUCH more important than the radio itself in ultimately getting your signal heard.

If you friend is reading 150 carries *out* of a single 6LQ6 something is
wrong.
He would have to be running at like 300 watts plate input power...around 350
ma at 800 volts, a 6LQ6 would be glowing red at 800 VDC.

OK, thanks for the info. Turns out the 150 might not have been as accurate as previously thought. If I remember correctly he said it might have been on the peaks but I am not sure right now. Here's the deal. Mine has a fairly decent tube, a little bit of silver burn type stuff on the sides but that's it. It only puts out 50 watts no matter what the modulation is (this is into a dummy load), even on SSB. Is this all I can expect or what?

Hey, I jsut received my Uniden GRANT LT and Astatic D104M6B microphone
from Copper's today!

I have just finished checking it all out and everything is fine and dandy.
All items were BRAND NEW and I did not detect any evidence of a refurbed unit
from all outward appearances.

I got a BRAND new rig and a BRAND new mic and a BRAND new mic plug that
I wired up and am using now.

I think I got a great deal. I bought the Uniden GRANT LT on the last day of
the Uniden $30.00 rebate offer. So essentially it will have cost me $109.95 for
the GRANT LT brand spanking new!

Not Bad at all.

Just wanted to let you all know that Copper's did come through for me.
No problems, no hassle, quick service and delivery.

Of course it could be a hit or miss kind of thing, but so far, they are on my
recommended list as is Bill's 2-Way Radio.

Bill Yee,

Out.

5000. Re: Cobra SoundTracker same as Uniden Dynamic Squelch Control?

Newsgroup: rec.radio.cb
Date: 2000-06-06 00:00:00 UTC

Source record: 38723

Well, I just got my Uniden Grant LT radio with a Astaticf D104M6B power mike
from Copper's.
I wired up the D104M6B mic and tested the unit out. It for sure has a top notch
receive
section! This receiver is as good as my Kenwood TS-440S receive section for
sure.
Right now in my neck of the woods, there is a loud buzz across the entire HF
radio band.
Sort of like someone in the area is running an noisey (RF wise) electric motor
sparking up
all the electrical static and buzz. I suspect the noise is really is in the
atmosphere (due to
the season and sunspot activity?) . Anyhow the point being, the Uniden GRANT
LT's ANL
totally suppresses and blanks out the electric staticy buzz (just like my
Kenwood receiver).
So that is real nice. My older lesser cheapy Radio Shack TR-430 rig, does not
eliminate
the static buzz interference noise with its ANL "on".

Anyhow, Copper's did me good and I just want to let y'all know that. They did
me okay.
Fast service too.

Bill Yee,

Out.

5001. Re: I'm crying in my beer.

Newsgroup: rec.radio.cb
Date: 2000-06-06 00:00:00 UTC
From: John Frantz <shittohell@hotmail.com>
Message-ID: <8hhm8o$2gd$1@nnrp1.deja.com>
Source record: 38724

Little different story but along the same lines:
A friend of the family's husband died about five years ago. Her husband had collected CB, HAM, and police band equipment & parts for around thirty-five years. Soon after his death I was invited over to "clean out" his shed. I was asked to "save the decent looking HAM radios" for an upcoming HAM Fest (her words - not mine).I was allowed to load up the rest of everything and bring it on home.
She refused to accept money for any of it, and said that it was "payment enough just to get all of it out of the shed" (again, her words - not mine). It took three bed-full loads to cart all of it off, but I managed to walk away with about $1500 worth of working & non-working radios, a crapload of assorted parts, bits, & pieces, and more tubes than I'll ever know what to do with.

Among the jewels were three antenna connectors sworn to've never made, several HAM amps, several police band amps, and three CB amps.

=====
About two months later on a sheriff's deputy buddy of mine spotted a crapload of VHF equipment beside the dumpster of the local power company's office. Three bed-full loads and two 16' flatbed trailer loads, to be precise.

Contacted a used 2-way company in College Station, Texas, the next day. After they heard the kind and quantity, they were more than willing to pay the shipping to get it all down there (damn that was a lot of boxes), inspect the equipment, and send it all back freight-paid if it wasn't "up to snuff".
Got a call two days after it arrived down there - let's just say they were impressed. Long story short: After I bought a dual police band band MTX & PC-programmer, a new CB system, and paid my buddy a "finder's fee", I still had over $800 in my pocket. Not a bad day's work, even if I do say so myself.

Just my 2¢,
John Frantz

* "CB Power, Frequency and Modulation Modifications" CD with -MANY- CB Modifications
($15.00)

$500 takes it all. You pay for shipping via carrier of your choice.
HOWEVER!
You will pay for confirmation of receipt that that carrier offers. I indicated
individual prices for MY purposes. No lectures on whether or not items are or
arent a good deal or not. "Thats my price and Im stickin to it"

Any interested parties should contact me at jeffherrings@MYhome.com
Take out the M Y after the @ before sending me email.

Im sure its obvious Im getting out of the CB sport, which it TRULY IS.
Its been fun, I have no regrets. All equipment is in A-1 condition.
The Dave Made is scratched, but, if that effects its performance thats news
to me. The top of the Power Supply is also scratched, still trying to
figure out how that happened. The Dozy has N-E-V-E-R had its needle "pegged",
however, the BIRD meter I am NOT selling did, unfortunately, but, it was easily
calibrated back to normal.

Anyway. Thats really about it I suppose. Knowing me, I'll probably
regret selling all this.. but.. We'll see.

My guess is that you are misinterpreting your data. Regardless, you are providing bad advice. The fact is that a transmission line will not shift or expand the SWR bandwidth. To suggest otherwise is a disservice to the newsgroup and that is why I had to respond. No more coax myths, please.

I've already suggested why you may have seen what you saw but you didn't respond to it. Coax losses will display an SWR bandwidth broadening but they are undesirable and, as such, they are a poor recommendation. I could put an attenuator in line with my coax and achieve a SWR bandwidth broadening. But who wants that?

5005. Re: Antenna Question ABS 1600

That is the antenna that I use on my station here. I have the bottom clearing the roof at about 4'. Which is around 16' from ground level. With a Old Cobra 148 GTL (barefoot)I have talked all over the country. With my Washigton Base with a little 225 behind it I have talked all over the world!! All in all I am pleased with it. However the OD green does give me flashbacks some times :) I was a 31C in the Army (radio operator) ..looks alot like the ones we used back then!!!

OTOH a properly tuned clothes hanger talks that distance as well...have done stuff like that on the other bands...

See ya

Message-ID: <20000606005859.16903.00001727@ng-fk1.aol.com>
Source record: 38730

I have a friend who is getting a Yaesu 757GXII from a friend of HIS (oh, this is sounding like gossip now!) but it's not coming with the microphone. Anyway, he has a Turner Super Sidekick he wants to wire up to the eight pin plug that the Yaesu requires... and I don't know the pinouts, etc. ...any info? Anyone?

5008. tuning a Little Wil?

Newsgroup: rec.radio.cb
Date: 2000-06-06 00:00:00 UTC
From: Dean Neumann <dneumann@neumann-associates.com>
Message-ID: <393C8D89.D9398F2E@neumann-associates.com>
Source record: 38731

CBers,

I have two handheld CBs, and I am looking for a convenient mobile antenna to use to enhance the performance of the handhelds while on multi-vehicle road trips. I've decided that a Wilson "Little Wil" mag-mount would offer a good compromise of convenience and performance, for an acceptably small price. But how do you tune these antennas? I will not always be mounting them on the same vehicle. Do they have an adjustment machanism, or must they be cut? When moving them from one vehicle to another, must they absolutely be retuned or will the SWR difference be negligable?

What about the Firestik DS11 mag-mount as an alternative? Does this have an adjustable tuning mechanism?

Sorry for the newbie questions, and thanks for all responses.

I just bought one mail order and installed it tonight. I installed a well-tuned 48" fiberglass antenna with good ground plane, got the SWR down below 1.1, and it works very well. I may get some disagrement here, but I'm of the opinion that most modern 4 watt radios are pretty similar in the RF department, and the only variable with a really big effect on performance is your antenna.

Things I like:

Small size makes for versatile installation possiblities.

Surprisingly good receiver audio (especially after I took the advertising sticker off the front, where it was covering the speaker). The speaker has "air vents" on both the front and back of the mike, so you can hear it even if the unit is lying face down. There's also a provision for an external speaker, plugged into the connector box where you wire up power and antenna, though I haven't used it.

Weather radio works well.

Controls are easy and logical. Getting it to scan all 40 channels was simple, and getting it to automatically listen to two channels, switching back and forth and stopping on a signal, is also easy.

Lighted LCD display is easy to read, but it's only really good if you're looking at the unit either straight on or from "below". If you have the unit mounted on a vertical surface below eye level, it's hard to read. It's easy to read if you're holding it in your hand, tilted back in a natural position.

Things I don't like:

Microphone is bigger and heavier than a standard mike, as you'd expect with all those controls.

Cable is also bigger and heavier than a standard mike cable.

PTT button is a bit small, without a really good feel, but I guess it's adequate.

The unit can't remember what channel it was using, or any preset memory channels, unless you wire it up to a source of constant 12V and keep it plugged in. If you ever unplug it, or if you have it wired to a switched source of 12V, it forgets everything you ever taught it each time the power is removed.

> I am wondering if this Cobra unit uses the same circuitry as the
> Cobra 148-GTL and if its audio modulation can be adjusted like
> the other Cobra's and Uniden's. Is it modifiable? If not does it
> put out a good signal and audio stock?

There is no obvious way to adjust modulation. I've read the entire owner's manual, and it makes no mention of modulation adjustment (except the "SoundTracker" feature). I don't anything about the 148-GTL.

I'm still new with this radio. If you have any questions that I could answer, or that the owner's manual would cover, email me (I don't follow this group all the time).

Assuming you are familiar with the operation of an SWR meter, A small set screw holds the metal stinger (whip) portion of the antenna in place, you simply loosen the set screw and slide the stinger in or out. If you need some help with actual setting of the antenna just repost, myself or another will answer..... Also once the antenna is set it should be close enough to move from vehicle to vehicle without retuning, but to be safe you should recheck the swr. if you don't have an SWR meter you should be able to get one relatively cheaply. And as a last note I think Wilson still prints helpfull tuning instructions on the Antenna package.

It has to be the peaks--otherwise it's not an
accurate figure.

> Here's the
> deal. Mine has a fairly decent tube, a little bit of silver burn type

Again, it depends on what you're measuring.
50 average watts is just right. 50 peak
watts is too low.

You are right. You will regret it later, and then have to start all over from scratch.
Believe me, I know. I went throught it twice, in '84 then in '93.
Live and learn. Once you get the bug, it can't be cured. It may go into remission for years, then suddenly (BANG!) full blown CBitis. Good luck and be strong!

Snip

It could be multiplied by 2.828, but using a specific number
like 2.828 tends to make you think there is a mathematical
conversion ratio of average/rms wattage to peak wattage
that uses this figure. There is not.

2.828 is a ratio that converts a peak to peak voltage to a
rms voltage.(or current) It has no use in converting wattage.

5017. Re: 3CX vs 4CX tube

Newsgroup: rec.radio.cb
Date: 2000-06-06 00:00:00 UTC

Message-ID: <le4%4.627$vV5.3186@newsfeed.slurp.net>
Source record: 38740

Never said anything about it being impossible, merely a bit more complex than looking at an EiMac poop sheet. I have no disagreement with a word the man says; if fact it makes my point. For the record, he is absolutely correct about the shunt fed final done in the manner he suggests. He may, however, be better served by friends who let him see the whole thread. He is hereby nominated as the King Kong of Tubes.

To clarify a point that I did not make very well, it is common in commercial service to keep tubes to their plate dissipation ratings along with a host of other things to prevent total failure. In the broadcast business, being off the air is at best expensive and can ultimately draw the nice man from FCC, less so of recent years but certainly so in the big days of tubes. General Electric in their VHF repeaters (law enforcement only) put their finals in a big block of machined aluminum to play heat sink and built two 375 volt supplies, cascaded to cut the plate voltage in the event of screen supply failure. I have no doubt that the three phase supply of the FM transmitter was more a case of having one or two working when the local power company dropped one leg. The point is simply that design follows mission; hobbyists can, do, and should stretch things out a tad. Before asking what is 'desirable', it is a great idea to know just what it is that is being done. Whatever else it may be, a 4CX-big number is not a beginner's project.

We might have some interesting discussion about power supply design for linear and particularly SSB service. For a prime example of lack of attention to it, WGTG's sideband transmitter is a great place to begin if you can hear them at all.

The only real difference we have is philosophical. If it don't get you paid, laid, or fed it is pretty hard to get interested. There indeed I am showing my age.

yes, good posting Bill, I printed it out for future
reference. I'm going to attempt to change a HTX-100 to a 455
final. just happen to have one laying around.

> distortion.

I have done this mod to a President Jackson, since I no longer have any 477's. I used a 455A (stud mount), and drilled right through the chassis and heat sink, and bolted it directly to it. I oriented the trnasistor such that one of the emitter leads could be directly soldered to the ground foil. Short leads were used for collector and base connections.

When it was all said and done, the radio worked fine, except it was lower on power output. Where I was in the 45 watt range with the 477, I was now seeing about 36 watts with the 455 (both on SSB). I belive this can be explained by the lower gain rating for the 455 over a 477. But this was certainly better than nothing at all. The 455 is also much more "resistant" to abuse. The owner of this particular radio had a penchant for doing things that stress the final, and had blown the 477 at least twice before, in a year's time. Since the 455 "upgrade", the radio is still going strong, despite the abuse it gets.

I checked my copies of ARRL books and 3 editions of BIl Orr's Handbook and could not find the equations for calculating SWR from forward and reflected power. They have the equations for voltage and current which is almost useless unless you are using a slotted line. I know it is in the books at work because I used the equation in a program to build a SWR table. Will be back at work Wed. and will post Thurs. morning if no one else has.

150 watts would be about right if you are talking PEP. I am pretty sure you can
interchange these tubes if the power supply can handle it.

Has anyone had any experience with the Midland 79-290 model radio? I am looking at purchasing one because it has all of the features that I want in a radio, weather band, SSB, advanced noise filtering etc. this will be my first experience with SSB. What kind of range and performance can I expect from it. I plan on getting my wife the same radio and I am hoping to be able to communicate with her around town, probably about a 10 mile radius on SSB. Is this a reasonable distance for SSB?

2 Chron. 7:14 is talking about the children of God (i.e: you & me). Have you "humbled yourself"? Doesn't sound like it. I'm not necessarily accusing you of anything... just calling your attention to some errant preaching & judgementalism. If I don't email you directly, I'm a false accuser?

I appreciate your desire to rid the world of Communism, and to divert money away from Communist nations. But there's also the issue of what works and what doesn't. To make this more topic-appropriate, I'll use a radio metaphor:

Let's say, I'm excited about CB radio. I think all my friends (& enemies) would love to be (and should be) involved. The last thing I should do is to come at them with judgment, saying things like, "You non-radio bastards! Cell-phones are of the devil, and therefore, God is against you." Do you think that would do anything to compell folks to use CB radio? Of course not! The same is true w/ Christianity. I'm sure you've heard the saying, "You can catch more flies with honey..." It's okay to be angry about atrocities and injustices in the world, but it's more effective to channel that energy into something that will actually make a difference. Just being pissed off and posting hatred & name-calling in a newsgroup doesn't do anything except make you feel self-righteous. Besides, name-calling is ineffective & childish, making me think you never got past the playground mentality.

> > They have messed with Christians there
> > also, therefore GOD is against them!!!
> > Dave!!!!!

You're forgetting, God actually loves them. They are still people. Jesus died for all of us -- even commies. What God is against is the sin that has blinded them. And why would you expect those who don't believe in the Bible to keep the ten commandments? Why are we surprised when people sin?

> That's right, IF a government "messes" with Christians, then they are
> messing with the apple of God's eye. Then God HATES them and WILL bring
> judgment to them, BIG TIME.
>

God doesn't hate them. Judgment is sure, but judgement is God's - not yours. Before you were a Christian, how would you honestly have felt if some "Christian" came up & started telling you what a dirty filthy sinner you were, and how God hated you. That's just not the way to do it.

> I know it happens everywhere, but the SUBJECT of this POST is to
> single out these commie murderous threatening bullies so I can inform others
> as to NO SUPPORT them any more. DO you have a problem with that?

No problem, but when posting it in a CB newsgroup, you'll have to deal w/ the dissent of the other CBers here.

> It would be love IF I wanted you to repent. If I
> wanted you to keep on in your communism then I would say Nothing and do the
> opposite of Isa. 58.

It's all in how you say it. If you come at somebody with your spiritual guns blazing, spewing anger & calling names, people will not listen to you. Jesus changed the world one heart at a time. Have patience, Dave.

While American houses are wired for 240 they rarely have it where you need it a
d putting it where you need it can be expensive. I have a friend who travels
overseas a lot and he has a converter that will go either way. Handles about
1kw and I don't remember it being too heavy. It is a transformer , not one of
those resistive things.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size
40 channel unit with carrying case. High/low TX power switch. Around
5 watts output on high. LCD display with TX and receive meters.
Great shape. Original long (around 5 feet) center loaded antenna. Has
external antenna, power and charging connections. Has an 5-pin
external mic connection as well. Uses 8 'AA's or 10 'AA's
rechargeables and you can recharge the batteries WITHOUT taking the
batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.
Great deal ! ! !!
A Picture can be e-mailed.

Not exactly. Taiwan has a freely-elected democratic government, and is an independent nation.

The People's Republic of China (ROC) regards Taiwan as a "rebel province". The original democratic government of China fled to the island nation of Taiwan when the ChiComs seized control.

Unfortunately, our spineless government has adopted a "one China" policy, which means that to appease the red communist bastards in Beijing, the US doesn't "officially" recognize Taiwan.

But Taiwan remains an important trading partner of the US, and enjoys strong support from freedom-minded Americans in private business and in government.

If you believe in supporting freedom-loving, courageous people, don't lump Tawainese-made products in with ROC junk. Likewise, if you care to look, you will notice that Taiwanese goods are very well made, and usually, more expensive than the items produced under near-slave-labor conditions in the ROC.

5040. FS: Uniden Laser/Radar Detector

Newsgroup: rec.radio.cb
Date: 2000-06-06 00:00:00 UTC
From: maher <doleh@home.com>
Message-ID: <YRd%4.167766$55.3528896@news2.rdc1.on.home.com>
Source record: 38763
Cross-posted to: alt.radio.scanner,rec.radio.cb,rec.radio.scanner

Uniden LRD 6599SWS radar/laser detector includes:
64 voice/text alerts
5 audio alerts
360 laser detection
laser, k, ka, x bands
vg-2 undetectability
dot matrix led display
electronic memory
singal strength meter
automute feature

This comes with all original equipment and was rarely used including,
hardwire power connector, cig lighter adaptor, manuals, box, clips.

Retails for about US$129, will accept something in the range of US$65-75 or
a trade.

email me at maherdoleh@hotmail.com if interested.

I agree. The proper figure is 4, but we're
talking Bird 43s here. Bird 43s overstate
the average wattage and convert to peak at
close to a 3:1 ratio.

> 2.828 is a ratio that converts a peak to peak voltage to a
> rms voltage.(or current) It has no use in converting wattage.

Again, I agree. My post (and even the part
of it that you quoted) was context specific
(focused on Bird 43s and how they respond in
a real-world situation).

5042. Re: New CBer

Newsgroup: rec.radio.cb
Date: 2000-06-06 00:00:00 UTC
From: the_g_man@my-deja.com
Message-ID: <8hjto8obq1@nnrp1.deja.com>
Source record: 38765

Here is my opinion...

Radio:

Get a Uniden 66 or 68XL or a Cobra 25Ltd. Buy the radio from a shop that does good tech work. I recommend Bill's 2-way (http://www.bills2way.com) or Fire Communications (http://www.angelfire.com/az/firecommunications/). Either of these shops will be able to peak and tune these radios for 25-30 watts out in AM mode for about $40. While that might seem like a lot of money to spend on a radio that costs less than $100, it's well worth it. These rigs are factory set for 3.8 watts, and the power output and alignment work makes a night-and-day difference.

Antenna:

The best antenna is a 102" whip. That's usually not practical for most people. Second best is one of the longer (48" or so) fiberglass wound antennas like a Firestick. Last choice is a base-loaded unit, with Wilson being the preferred brand. Try to mount your antenna as close as possible to the dead center of your vehicle - the center of the roof is great, the forward center edge of your trunk lid is good, the farther away from dead center, the more directional your signal will become.

Installation:

It's everything. Your antenna/coax must be tuned for a low SWR. Without getting technical, this is the measurement of how much power is radiating out of your antenna vs. how much is reflected back to the radio. In the real world, some always comes back. If too much is coming back, it will not only degrade your signal, but it can damage your radio. While this sounds ominous, it's easy to take care of. Invest $20 or so in a SWR meter when you buy your radio, or find someone that has a meter to help you. I suppose you could always buy the meter from radio shack and return it when you're done, but I would never suggest anyone do that.

Add-ons:
Don't be sucked in by the sound toys and stay away from linear amplifiers. You can always get into this kind of stuff later, but you will get the most bang for your buck spending it on your rig, the tune-up and your antenna.

Hope this helps...good luck.

My neighbor had a problem like this with his Jeep. He had the antenna mounted on the rollbar. He moved the antenna to a ball mount mounted on the side and the problem went away. I think the bar was a poor counterpoise for the antenna and was causing the shield to radiate.

Stud mount transistors would be handy for this type
of change over. It's too bad they're not as readily
available (or as cheap) as they used to be.

I like the direct ground too. The 455 is unlike the
477 in that the flange isn't grounded. As I remember,
the heatsink in the 2510 style radios is at chassis
ground which helps the 477. That's not the case with
the Jackson.

> When it was all said and done, the radio worked fine, except it was

> was now seeing about 36 watts with the 455 (both on SSB). I belive this
> can be explained by the lower gain rating for the 455 over a 477.

I agree. I just put a 477 in a 2600. The DC Beta
of the 477 was 120. That's a little hot for a
power transistor in my opinion.

> But
> this was certainly better than nothing at all.

By a long shot!

I wouldn't want to use a 455 with a DC Beta of 120
in this kind of a situation. It's better to lose
10 watts than to risk stability problems.

> The 455 is also much more
> "resistant" to abuse. The owner of this particular radio had a penchant
> for doing things that stress the final, and had blown the 477 at least
> twice before, in a year's time. Since the 455 "upgrade", the radio is
> still going strong, despite the abuse it gets.

The reliability is the best part. I dislike
the 477 and 497. They represent an abuse of
a case style. It's no wonder Motorola decided
to quit manufacturing the.

The output in your example is still plenty high
enough to drive an amp. Some guys like to run
big carriers on FM. The 455 will allow that too.
There are alot of advantages to the use of the
455. I'm sure a Uniden engineer realized that,
and that's why the 455 is in the newest Lincolns.

Did you do anything to enhance stability (feedback,
base to ground resistance, etc.)?

How about biasing? Did you use the standard
50 mA or did you go higher in order to boost
the output?

Thanks for the additional info.

> Is this a reasonable distance for SSB?

Range depends on many variables. The old rules
of thumb for stock radios are: 5 miles mobile
to mobile; 10 miles mobile to base; and 15 miles
base to base. Of course those rules are far from
being carved in stone. The 79-290 tunes up well
and can be modified for extra (quiet) channels
fairly easily. Those things combined with the
"three As" (antennas, altitude and amplifiers)
will increase your range if need be.

There is avail a 10M High Power Kit that will replace many of the finals on the 3600 series circuit boards that use the 2SC1969 final. The circuit consists of a MRF497 final with other circuit components that yields 45 watts output. The MRF497 alone is worth $35. The whole kit sells for $40.
A while ago, RF Parts in CA had the circuit change to replace all MRF477 finals with the MRF497 (HR 2510 & HR 2600).

You betcha. As a kid in 1963-64, I couldn't get
out for beans with a vertical. I tried a dipole
and folded dipole. Same story. I then bought
out all the 8 ga stranded wire that a surplus
store had - 3 spools, as I recall. I strung that
wire from my 2nd story bedroom back to a pine
tree perhaps 40 feet up, thence back to another
tree perhaps 40 feet up, then a long run of maybe
200 feet to a pine up maybe 25 feet, then down to
a chain link fence I used as a DC ground (and RF
ground). I loaded that sucker up on 160 meters
on up through 10. I worked the US at night on
160 and pretty much anywhere in the day on 15.
10 over 9 into Italy on 65 watts. Strong reports
into the Scandanavian countries. England was
disappointing. Only worked it on CW with 569
reports (not strong). Probably the crazy pattern
caused by that very long wavelength antenna.

> And can anyone tell me if a cobra 148-GTL-ST

> will get me out over the united states?
>
> thanks,
> tk (cat)
>
If conditions are good, up on 10 and 11 meters,
you don't need a lot of power for good distance.
I worked Webster, New York from Guam Island (a
distance of perhaps 10,000 miles) in 1968 running
a Collins KWM-2 barefoot with 15 watts into a 6
element beam.

If conditions are bad, you won't work 'em. I
recall one time the XO of the communications
station wanted a phone patch and the states were
comming in only S2. Bear in mind, we had no
interference, being surrounded by thousands of
miles of salt water. We called, but the stations

that heard us said we were too weak and buried in noise for a phone patch (we were running a kilowatt to the 6 element beam). He ordered up a military 40,000 watt output transmitter into a rhombic antenna pointed stateside. The rhombic was a huge diamond shaped antenna, 200 feet high and 600 feet on EACH leg of the diamond. He got his phone patch and we were running 40 over 9 in the US. Bear in mind, I am guessing (and I doubt I'll miss the figure by 50%) we were running between 1.0 and 1.5 MILLION watts of effective radiated power. And, there are times you will hear absolutlely nothing and all the power in the world won't help.

For now, I am contented with other electronic toys and my only radio runs on six aa batteries. I enjoy a consistant 40 mile communications range with it on FM.

73s,

Jim

There are a couple of good answers in this forum to your question. Pay particular attention to the 'antenna' answer. A good antenna will help you both in transmitting and receiving. If you are going to run base, you could build (or buy) an antenna that will FAR outperform any mobile installation. How about getting the mobile and build (or buy) a power supply so you can also run it base? That way, you have both the use of it in your vehicle, and with a good antenna, you'll get more range out of it (not to mention you can actually use it) in your house as well!

In any case, you'll have a lot of fun experimenting with antennas, getting them tuned - trying different coax types, mounting them, climbing towers, hey, even phasing antennas.

Actually, I think you'll have a ball.

Enjoy!

73s, Jim (AA2QA and former CB bunny hunter fanatic)

>
>Can anyone tell me if the ABS 1600 antenna will let me reach out and talk to
>people over long distances. (300-400 Miles)??
>

The question here is will the SUN let you reach out ...

I have an ABS-1600 up 56 feet at it's tip over an 8 foot high aluminum shed, (my shack), with a home brew skip kit which consists of a stainless collet patterned after the Antron one and 4) 10 meter 1/2 & 1/2 fiberglass and stainless whips as radials.
My match is 1.2:1 on ch 20 and less than 2.0:1 from 26.5 to 27.7.
The first night that I had it up, I talked from here in W. central Florida to Texas and Lousiana with no problem at all using a Uniden PRO-810-e base at 8 watts low band AM to Louisana and 20 watts high band PEP to Texas.
It's performance rivaled my twin cophased Antron 99's that the sun had beat to death.
It's still new so I will wait and see if it's finish stands up to the UV and it's guarantee.
It's a 5/8 wave as opposed to the antron's 1/2 over 1/4, feels a whole lot sturdier and is less than the cost of the two Antrons were together although not by much when you figure in the $22.00 price tag for shipping.
I bought mine from Copper for $79.95.
If you put it up on a 40 foot push up like I did, unless you're a gorilla, you may want to get some help as the antenna and pole get a bit unstable before you finish with the second stage. I guyed mine down to 4 points at 2 stages.
Luckily, the power lines in my area are all underground but if your's are not, take the usual precautions as the 14,000 volt insulation warning only applies to the antenna and not the mast and even then, if the fiberglass were to fracture if it hits a power line while falling, that insulation goes out the window along with the antenna and most of the flesh from your hand to your leg.
I think it's a great antenna so far.
Good luck and be careful.
Jeff

BUT YA GOTTA REMEMBER ... IT'S JUST A JOKEY JOKE!!!!

How many women with PMS does it take to screw in a light bulb?

One.

ONE!! And do you know WHY it only takes ONE?
Because no one else in this house knows HOW to change a light bulb. They don't even know the bulb is BURNED OUT. They would sit in this house in the dark for THREE DAYS before they figured it OUT. And once they figured it out they wouldn't be able to find the lightbulbs despite the fact that they've been in the SAME CUPBOARD for the past SEVENTEEN YEARS. But if they did, by some miracle, find the lightbulbs, TWO DAYS LATER the chair that they dragged from two rooms over to stand on to change the STUPID lightbulb would STILL BE IN THE SAME SPOT!!!!! AND UNDERNEATH IT WOULD BE THE CRUMPLED WRAPPER THE STUPID #)#(*(*^*&% LIGHT BULBS CAME IN. WHY??? BECAUSE NO ONE IN THIS HOUSE EVER CARRIES OUT THE GARBAGE!!!! IT'S A WONDER WE HAVEN'T ALL SUFFOCATED FROM THE PILES OF GARBAGE THAT ARE 12 FEET DEEP THROUGHOUT THE ENTIRE HOUSE. .....

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!

2 Chron. 7:14 is talking about the children of God (i.e: you & me). Have
you "humbled yourself"? Doesn't sound like it. I'm not necessarily
accusing you of anything... just calling your attention to some errant
preaching & judgementalism. If I don't email you directly, I'm a false
accuser?

Yes I have humbled myself. Just because I don't sound like your
wimpy state preacher, doesn't make me arrogant. The false "church" teaches
that you can't judge. Ther Bible teaches otherwise. You are suppose to
come to me directly if you have something against me. If you don't, then oh
well...

I appreciate your desire to rid the world of Communism, and to divert
money away from Communist nations. But there's also the issue of what
works and what doesn't. To make this more topic-appropriate, I'll use a
radio metaphor:

Let's say, I'm excited about CB radio. I think all my friends (&
enemies) would love to be (and should be) involved. The last thing I
should do is to come at them with judgment, saying things like, "You
non-radio bastards! Cell-phones are of the devil, and therefore, God is
against you." Do you think that would do anything to compell folks to

use CB radio? Of course not! The same is true w/ Christianity. I'm sure you've heard the saying, "You can catch more flies with honey..." It's okay to be angry about atrocities and injustices in the world, but it's more effective to channel that energy into something that will actually

I am making a difference. Cell phones ARE radios, by the way. I wouldn't come up with what you have stated. I'm don't have sugar in my mouth for those jack booted murderous thugs in China. Tell me how I can "lovingly" say the same thing? The only ones I upset by that language is the commies themselves. And I learned from the Rev. Spy in the 40's that the churches are full of them!

make a difference. Just being pissed off and posting hatred &

Hatred? Hating evil? That is what we are suppose to do. Or do you love evil?

name-calling in a newsgroup doesn't do anything except make you feel self-righteous. Besides, name-calling is ineffective & childish, making me think you never got past the playground mentality.

The commies are still in the playground. They are called the BULLIES now !

> > They have messed with Christians there
> > also, therefore GOD is against them!!!
> > Dave!!!!!

You're forgetting, God actually loves them. They are still people. Jesus

NO he doesn't. He only will love them IF they repent and keep his commandments. THIS is the Biblical definition of love. Look it up! God loves thugs that raid house churches and cart off people to the pokey? Are you mad?

died for all of us -- even commies. What God is against is the sin that has blinded them. And why would you expect those who don't believe in the Bible to keep the ten commandments? Why are we surprised when people sin?

No, HE is against them for their sin. People in this Country use to keep the 10 that were not necessarily Christians. We need to tell them of the Good
News that they can BE SAVED FROM their SIN. Repentance. Quit.

> That's right, IF a government "messes" with Christians, then they are
> messing with the apple of God's eye. Then God HATES them and WILL bring
> judgment to them, BIG TIME.
>

God doesn't hate them. Judgment is sure, but judgement is God's - not

Yes HE DOES HATE the Governments that MESS with HIS Bride!

yours. Before you were a Christian, how would you honestly have felt if some "Christian" came up & started telling you what a dirty filthy sinner you were, and how God hated you. That's just not the way to do it.

That would be the truth, and I would say WHAT do I have to do to be saved? This is what the Bible teaches YOU should do, not what your wimpy NIV state church teaches. That IS the BAD news is that we were once were or are NOW sinners. The GOOD news is that He has provided away to save us from SIN. SIN causes death.

> I know it happens everywhere, but the SUBJECT of this POST is to
> single out these commie murderous threatening bullies so I can inform others
> as to NO SUPPORT them any more. DO you have a problem with that?

No problem, but when posting it in a CB newsgroup, you'll have to deal w/ the dissent of the other CBers here.

> It would be love IF I wanted you to repent. If I
> wanted you to keep on in your communism then I would say Nothing and do the
> opposite of Isa. 58.

It's all in how you say it. If you come at somebody with your spiritual guns blazing, spewing anger & calling names, people will not listen to you. Jesus changed the world one heart at a time. Have patience, Dave.

I do. 2 Chron. 7:14 is the answer. Are YOU part of the problem?
Dave

Source record: 38791

Red button turns amp on.
White button turns preamp on.
Green/Orange button marked AM. (more below)
Yellow button marked SSB. Adds a delay to the relay.

The AM and SSB buttons control the power. Both out is max. SSB in is one
notch less. AM in is two notches less. Both in is three notches less.

The SSB button will also add delay to the PREAMP.

Feed it with a minimum 8 gauge to the battery and try to use mini 8 or
better coax. And don't give it more than about 5 or 6 watts per pill
dead key. 4 watts swinging to 25 or 30 would sound a lot better. <:

Cross-posted to: misc.survivalism,rec.radio.amateur.equipment,rec.radio.cb

On Mon, 05 Jun 2000 03:38:43 -0400, DX7 <Spook10@ifreeedom.com> ,
sharing an opinion worldwide on misc.survivalism, and inviting
comments from others, caused the following words to appear on our
monitors:

>Another reason to get a ham license:
>It wouldn't surprise me to soon see scanners outlawed. However
>In a fit of wisdom congress made a law that said ham operators
>could have receivers that would receive law enforcement signals......
>nuff said....
>

1==> Does this mean that the Icom general coverage receiver that
covers from 100 KHz up to 2.2 GHz or so will now be available in the
US? Have a mate who has one, and before buying it he was showing me
the details from an electronics catalog. Noted that there was a
warning that this continuous coverage communications receiver was
not available to US customers.

2==> However, even if the law allows a receiver owner to monitor a
communication, it may still be illegal for him to communicate that
information to anyone else, use the information for an illegal
purpose, etc.

I was not aware that the stud mount device was any more scarce(or more
expensive) than the "flange" mount type. I'm still using old stock that
I obtained 10 years ago.

>

Right. The flange is not grounded. I used one of the emitter leads, and
fortunately, it was long enough to reach the PC board and I could solder

it directly to the ground foil.

I'm curious, it sounds like you can choose the gain of the transistor. I was not aware that you could do this, other than buying "matched" pairs or "selected" parts, which can deviate from the specs by small amounts, but not by that much.

I agree, if your intent is to drive an amp (which most people that have this type of radio do, these days), that 10 lost watts is not going to amount to much, except for some lost "swing" that so many people drool over. Unfortunately, there are many people that are ready to jump off a bridge if they lose even one watt of power. They seem fixated on their wattmeters. I don't have the heart to tell them that their usual choice

of wattmeter is probably lieing to them anyway.....

>

In this case, no. The radio played fine, with no spurious (I was surprised. I was expecting instability).

>
> How about biasing? Did you use the standard
> 50 mA or did you go higher in order to boost
> the output?

I set it at about 85 ma, using a 2 tone test and tuning for minimum distortion on SSB.

Tuned into 3.941 last nite per a tip via
an e-mail from a SWL. I was expecting a couple
of farts to be duking it out or something else
lame and ham-mish. Instead, there it was!!
THE PORKBUTT SONG bein played at a room filling
15dB-over-S9! The cherry on the cake was an
occasional drop-in of an echo-chamber which
only enhanced the "aye..aye...ayeeee" More listening
seems to indicate that there has been a radio war
going on for a bit between a group on 3.941 and 3.945
Yes folks, it looks like this is a spot that holds much
potential radio fun SWL'ing. Enjoy (..ya've earned it!)

The only way that Taiwan will return to red china control is by being taken by force - and that ain't likely. Hong Kong was handed over by another nation, Taiwan is not likely to hand themselves over to commy control. In the event of an attack by the reds, the Taiwanese would cause massive losses that the reds couldn't hack - not to mention the huge amount of shit they would cop from the world in general. Despite the current spineless response to china from many countries the response would be overwhelming and they realise that they wouldn't have a leg to stand on. IMO!!

No, those scanners are not available not because of law enforcement
frequencies but because they cover cellular phone frequencies. It is
illegal to intercept cellular phone transmissions even if you are a ham
operator.

> well...

So, you believe the New Testament is "False?" Ahem... Luke 6:37 says: "Judge not, and you will not be judged; condemn not, and you will not be condemned; forgive, and you will be forgiven."

More thoroughly, Matthew 7 says: "(v.1) Judge not, that you be not judged. (v.2) For with the judgment you pronounce you will be judged, and the measure you give will be the measure you get. (v.3) Why do you see the speck that is in your brother's eye, but do not notice the log that is in your own eye? (v.4) Or how can you say to your brother, 'Let me take the speck out of your eye,' when there is the log in your own eye? (v.5) You hypocrite, first take the log out of your own eye, and then you will see clearly to take the speck out of your brother's eye."

And 1st Corinthians 4:5 even tells us: "Therefore judge nothing before the time, until the Lord come, who both will bring to light the hidden things of darkness, and will make manifest the counsels of the hearts: and then shall every man have praise of God."

There are three passages that explain to us that judging people is simply not our job. And, by the way, wow - you know who my preacher is? Amazing!

> I am making a difference. Cell phones ARE radios, by the way. I

> Hatred? Hating evil? That is what we are suppose to do. Or do
> you love evil?

You missed the point, Dave. Honey will catch more flies than dung will. Kindness (the Way of Jesus Christ) will do wonders if you let it. But I doubt that you believe the teachings of Christ, based on what you've stated thus far: Calling names, anger, hatred of people, stating that "Got hates" certain people. You need to take a look at the New Testament.

>
> The commies are still in the playground. They are called the BULLIES now !

Sounds like an excuse to call people names, Dave... and a poor excuse at that. Name calling is still childish. Try approaching issues with thought, research, and intelligence. It'll earn you more respect that just calling people names. Have you done ANY reasearch?

>
> You're forgetting, God actually loves them. They are still people.
>
> NO he doesn't. He only will love them IF they repent and keep his
> commandments. THIS is the Biblical definition of love. Look it up! God
> loves thugs that raid house churches and cart off people to the pokey? Are
> you mad?

What you've described in conditional love. If God's love was dependent on our actions, that might be true. But it's not. God loves us no matter what.

He never EVER said, "I love you IF _____." Even when they nailed Him to the cross, He said, "Father, forgive them; They know not what they do." What Bible are you reading, Dave? Remember Saul, the persecutor of Christians? He literally killed Christians for a living in ancient Rome. But God loved him in spite of his obviously heinous sin. In fact, he spoke to Saul personally on the road to Damascus -- and guess what? Saul the persecutor of Christians actually BECAME Paul the Christian... and a darn good preacher at that!

>
> No, HE is against them for their sin. People in this Country use
> to keep the 10 that were not necessarily Christians. We need to tell them
> of the Good News that they can BE SAVED FROM their SIN. Repentance. Quit.
>
> Yes HE DOES HATE the Governments that MESS with HIS Bride!
>

Sounds like you need to read Romans 5: Verse 6 "While we were still weak, at the right time Christ died for the ungodly. v.7 Why, one will hardly die for a righteous man--though perhaps for a good man one will dare even to die. v.8 But God shows his love for us in that while we were yet sinners Christ died for us."

This basically says that even though we're the lowest of sinners, God still loves us enough to have sent His only Son die for us. Welcome to the New Testament, Dave. Even while the Communists are sinners, God loves them so much that he sent Christ to die for them. And John 3:16

refers to EVERYONE. You've read John 3:16, haven't you Dave?

And I'm not necessarily talking about governments, but rather, individual people. People won't go to hell based on what government they were a part of. People go to hell because they didn't accept the free gift of salvation that God has offered through His Son. It's pretty simple, really. God doesn't automatically send entire governments to hell.

>
> That would be the truth, and I would say WHAT do I have to do to
> be saved? This is what the Bible teaches YOU should do, not what your
> wimpy NIV state church teaches. That IS the BAD news is that we were once
> were or are NOW sinners. The GOOD news is that He has provided away to save
> us from SIN. SIN causes death.
>

So, you wouldn't be offended if someone came up to you & started insulting you about your spiritual condition? How did you become a follower of the Bible? [I won't call you a "Christian" since your posts do not reflect the attitude of Christ, nor have you ever mentioned His Name.] But really, did you become a believer through someone insulting you, or was it through love & compassion?

>
> 2 Chron. 7:14 is the answer. Are YOU part of the problem?

Alright then... Here's what 2 Chron. 7:14 says... "If my people who are called by my name humble themselves, and pray and seek my face, and turn from their wicked ways, then I will hear from heaven, and will forgive their sin and heal their land."

I have humbled myself, I pray, seek God's face, and I have turned from wicked ways. God has forgiven my sin. [Also, this verse specifically says "My people who are called by My name." This is referring to followers of God -- not communists or Atheists.] So now what? Read the verse again! Does this verse command us to shout on street corners? Does it tell us to call people names? Does it even tell us to be angry?

In fact, the only time Jesus was angry was when "religious" people were using the temple as a marketplace. Yeah, Jesus was not "in" with religious people. In fact, they're the ones who crucified him! Do you believe that Jesus was the Son of God? Do you even read the New Testament? I'd hate to think that you were basing your arguments on only half of the Bible, Dave. I use the whole thing.

As for your comment "Are YOU part of the problem?" ... I won't be drawn into defensive mode. Sorry, it won't work. I stand by the whole Book. You obviously don't.

well it looks like their time is coming, it seems uncle is busy in the enforcement mode again. riley is on his white horse riding to the rescue. what is interesting is how they catch people jamming and whatnot, even though they are mobile. to me, it is really silly how much of the fcc's time is spent investigating reports of exams being fixed or sold, or whatever and rampant cheating . good grief, is it really necessary to cheat on a damn no code test? give me a break, boy these people must be real crackerheads. oh well, this is the face of the new ham radio band. come on in boys the water is hot, its been this way on the 11 meter band for 30 years or so, but you all already know that , but at least we admit it,.....cd is out....

Get real. It took three minutes to expose a obvious troll and it was
well worth it. If you had any knowledge of the internet you would
be able to confirm the accuracy of the posts. You are either to
lazy or to ignorant to do such, so you choose to post your
unnecessary post.

US law has been that way since at least 1955. I had to monitor some comms as a telephone co. employee but our FCC forbid me to whisper a bit of it under pain of severe fines.

I would tell him but we will need to conduct a seance. Doug passed away
about three years ago. Maybe we can get that boy from "The Sixth Sense"
to talk to him.

George is correct. Out of respect for the dead, I'll leave it at that.

Which is because many telephone users weren't smart enough to realize that
thing in their hand was a radio...

Now that the majority sold are digital, or unreadable in a plain receiver
it shouldn't make any difference if you could receive them or not, but
unfortunately there are still some of the old hand sets out there that users
still think are secure.

Gary,
If your absolutely sure there has been no change in the radio,
then you might check everything from the radio to the antenna. No
kinks, nicks, connections really are connected, etc. Check the
antenna system for continuity. Just for 'grins', check the radio
for output. Are you sure you have the right antenna on the radio?
If you haven't found the problem at this point, go back over the
same things again, your 'missing' it some where.
'Doc

hi jarry, show me where i did any of the things you claim. for the sake of any little credibility you have left it would be good to see you back up at least one of your statements in this newsgroup. if your reffering to us calling you a troll then i dont know what to tell you except stop being one. just for your sake jarry i decided to post the definition of the word troll just so youll see its a description of your actions and not an insult to your person.

troll- Person that gets a thrill from posting "flames" (really obnoxious messages) just to get a rise out of people.

i'd say with all your post about the supposed amplifier legality debate when there was no such debate going on and by your actions of taking mine and other peoples posts from here in rec.radio.cb and reposting them in amateur newsgroups just to start trouble that you fit the bill just right to be troll candidate #1

congratulations

All The manufacturer does is block those frequencies. It is the same with ham radios. Look at any advertisement for a radio that would cover those freq.'s and it will say cellular blocked.

Anyone have any experience with these
radios? How do they compare with the
old President Grant DX radios? Comments?
Thanks...
Bob

The original Wawasee Electronics is long out of business. There are a few people around here who claim to be part of that original company, but I wouldn't buy into their story.

If you have a black cat question, drop me a note direct and I'll try to help.

cheers

sorry for the slow reply, i had to find the paperwork....

This is quoted from the mod sheet that accompanied one of my
Deltaforces....

first my apologies, it is a Resistor not a diode.....

Add a 47k ohm resistor either chip or 1/8 watt to the empty R509 pads on the
front panel circuit board

I've never bothered to do this, i like how the radio defaults to 10 meter
only operation when its power is interuppted!

Also to the person who claimed default 10 meter mode was a lie here is
another direct quote....

When turned off and on again, the radio will always default to original
10 meter......

I would guess that the fellow who said his did not has already had the
47k ohm resistor installed in his...

Discuss?.......DISCUSS?.........

In discussing a issue you must have a willingness to listen if the
discussion is worth discussing in the first place. You are only
willing to go down a one way street. You by default take every
opportunity to attack and discredit everything and everyone involved
in CB.

End of discussion.

Dave or Debby,
Like most 'crusaders', your opinions are not devinely inspired. More like they're inspired by some misconcieved idea of personal gain, not necessarily money, a sense of accomplishment maybe(?), who knows. And, like most 'crusaders' your point is overstated to the point of being rediculous, borring, and incorrect. Sooner or later you'll get around to telling us what your trying to sell. Why don't you just 'cut' out all the rhetoric and tell us what you want us to believe, how you want us to behave, what we should or should not buy, where to buy it, what to pay for it with, and what we should do with it after we get it?
Should we call you "Brother Dave" and "Sister Debby"? Do you offer 'prayer' cloths? If we put our hands on the monitor while reading your posts, will we 'feel' the goodness and enlightenment come'n through? Will your 'preaching' and a quarter buy a cup of coffee? You bet! Puke a buzzard!

It's my understanding that none of the manufacturers
produce stud mount devices anymore. Also, RF Parts
doesn't have any 455As, and the As they do have
(450s and 453s) cost more than their flange mount
counterparts.

> but not by that much.

Motorola has their "gain group" system which allows
you to select gain ranges. The devices have colored
dots or letters that tell you which gain group the
device came from. As far as Motorola is concerned,
two devices from the same gain group can be used as
a matched pair. RF Parts goes beyond that with their
matching system and selected parts system, but in my
experience the extra effort doesn't net the end user
anything but a bigger parts bill. In my experience,
as long as the devices are from the same gain group
(for Motorola devices) or from the same lot (2SC and
SD devices), they can all be considered as "matched."
My own gain and leakage tests are proof of that.

Getting back to the original point, with Motorola
you can request that your devices come from a specific
gain group. No other manufacturer of popular HF power

transistors offers that. The original stripline HF
amp design that all the modern solid-state CB amps are
derived from is Motorola's EB-63. In that design they
mention the use of devices (454s) that have a DC Beta
of 40, and that 40 is actually a little high for what
they had in mind. The manufacturers seem to have lost
sight of that. The typical DC Beta for bulk HF power
transistors these days is 80-100. That's why most CB
amps are at least marginally unstable. The problem
is that Motorola devices are rarely used in the popular
CB amps these days. Most use Toshiba devices or SD1446s,
none of which can be ordered in a low-gain version.
On top of that, many amp manufacturers don't even know
that they could put out a more stable product that makes
just as much output power if they were to use lower
gain devices. CB amps are rarely under-driven. In the
gain compressed region there is no difference in output
between low gain and high gain devices. Of course all
of this is aimed at the general readership. You (Dave)
probably already know all of this.

And even that will depend on the amp. With a one or
a two device amp, 36 peak watts is plenty enough to
drive it well into the gain compressed region where
10 more peak input watts won't mean that much.

> Unfortunately, there are many people that are ready to jump off a
> bridge if they lose even one watt of power. They seem fixated on their

> wattmeters. I don't have the heart to tell them that their usual choice
> of wattmeter is probably lieing to them anyway.....

Most guys (even the wattmeter fixaters) are also
looking for reliabilty. Nothing is worse than
not being able to use your favorite radio because
it's broken. That's the tact I take when dealing
with customers. Reliability is foremost, and power
is just a matter of amplifier selection. A two
device "modulator" style of amplifier can be used
with the weakest of radios and will easily outperform
any stand-alone radio regardless of how involved
the transmitter mods are inside that radio. On
top of that, the reliability is obviously going to
be better with a radio and an amp when compared to
some maxxed-out radio that runs hot and is starved
for DC.

> > Did you do anything to enhance stability (feedback,
> > base to ground resistance, etc.)?
>
> In this case, no. The radio played fine, with no spurious (I was
> surprised. I was expecting instability).

That's great news. My feeling is that the tran-
sistor you used wasn't a really high gain one.
If it were, you probably would have had to at
least add some negative feedback. In any situ-
ation like this, I'd probably go with at least
a .1 cap and 100 ohms (used as a negative feed-
back loop) just to make sure nothing weird happens
when the guy tries to drive an amp or feed a mis-
match.

> > How about biasing? Did you use the standard
> > 50 mA or did you go higher in order to boost
> > the output?
>
> I set it at about 85 ma, using a 2 tone test and tuning for minimum
> distortion on SSB.

Again, I think you did the right thing. I don't
think 100 mA or so is too much in this appli-
cation since the input drive is light. 85 mA
is definitely in the proper range. And how
many CB techs tune for minimum distortion and
maximized spectral purity these days??? I
doubt there are more than 100 in the entire U.S.
that even know how to use or own a spectrum
analyzer.

Again, thanks for the additional info. This
has turned out to be one of the best threads
I've seen on this newsgroup in months.

I don't doubt the math but I'm not done yet. I have no mobile setup
to counter your calculated results right now but I will attempt to do
a actual real word measurement of a 1/2 and 3/4 wave coax. This coax
is from the same lot and will be used as the only variable in a SWR
sweep. I will post what is measured.
A SWR meter can not be fooled. If it sees a improper load then a
radio also sees a improper load.

I've had a few silver eagles in here, though not that exact one, i would imagine its a pair of MRF454's probably the same basic amp as palomar 225, etc. those can be purchased off the net for under $100 and about half that wholesale, they work, should be able to get it cheap, if not pass on it and buy a new amp...

Yes i use a awa for 2 metres and it is big, baulky, hard to set up and a very good radio for getting out with. I guess you can't have everything with my budget. I do still have these v200 icoms though and would hope to find something to program them and operate them on the 2 metre band.

cheers Mike

>
> 46 ohm - J 52.4 2.848 : 1
>
> >- the frequency at which the coax is 3/4 or 1 wavelength
>
> 300mhz

OK. Here's what I get:

Termination = 46.000-j52.400 ohms at 306 MHz
50 ohm Transmission Coax Input
Line Length at 300 MHz Impedance at 306 MHz SWR
---
0 degrees 46.000-j52.400 2.854:1
85 degrees 22.308+j23.927 2.854:1
90 degrees 24.494+j28.631 2.854:1
95 degrees 27.363+j33.622 2.854:1
265 degrees 23.788+j27.225 2.854:1
270 degrees 26.437+j32.126 2.854:1
275 degrees 29.913+j37.316 2.854:1

There is no change in SWR from 0 to beyond 3/4 wavelength.
The SWR is constant regardless of line length.

Message-ID: <16G%4.357$wb7.1736@newsfeed.slurp.net>
Source record: 38924

I picked up a linear today to fix and got the whole story behind it. It appears to be a hand built unit that's almost a gunmetal color with nice stickers on it. The stickers say TS-600V, Rec Amp, and Power. There are two small togle switches on it as wel as a pot with a small knob. The heatsink is internal, but it has a cheesy fan sitting on top of the top case half. The boards look like they are mass produced, and it looks to be a Texas Star rip off. It has one 2290 driving 4 2879s. Sound familiar to anyone? This unit had burnt up once and it was repaired. The guy picked it up and the tech told him he replaced 3 transistors in it, and went all over it. After checking it out the tech left it dead keyed into a dummy load over night. The guy told me he picked it up, hooked it up and immediately it was trashy sounding, low power, and seemed to be struggling and making noises. I got it home and opened the cover. As soon as I took one look I noticed that one of the 2879's was put in backwards. Also while soldering that 2879 in the wonderful tech managed to melt away half of one of the relays in the box. Upone furher examination the plastic was melted and the contact arm had been heated and seems to have lost it's contact. How can I convince all of the people around here that this "tech" is a hack? I have fixed so much of his magical work, and nothing seems to surprise me anymore. I have seem some weird things this guy does, and he's the one everyone praises. I hear people an hour on the other side of me talking about this "tech" and they drive 2 hours so they can get there stuff "fixed". What should I do I hate bad mouthing someone, but he really is a hack.

With that setup I am sure you will work around the country, Mexico, the Carribean and Canada (when conditions are good), although "extra channels" would greatly help you. I've worked Europe from a mobile at 25w and a Wilson 500 antenna. The key is the "extra channels" - that should cost you about $20 if you can find a local "tech" to do it for you.

5155. Re: SWR question

Newsgroup: rec.radio.cb
Date: 2000-06-08 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000608025327.11570.00004417@ng-ch1.aol.com>
Source record: 38928

Assume you have a loaded whip on a car that has an input impedance of 33 ohms(fairly typical) with a 1/2 wl of coax connected to the antenna the radio will see a load of 33 ohms with 3/4wl of coax connected the radio will see about 75 ohms. It is possible that the radio will operate better into the 75 ohm load and it may appear to be slightly more broad banded than working into 33 ohms. While the impedance of the radio does not effect SWR it can appear to. If the output impedance of the radio is not exactly 50 ohms(say 60) which is not uncommon) the 75 ohms will be a better match and the SWR will appear broader. The reverse could happen if the output of the radio was 40 ohms.

You describe what seems to me is a common situation, not much you can do except keep fixing his screw ups, if you start bad mouthing him his buds and customers will most likely do the same to you, when someone brings a piece to be fixed, if it is a hack from the other fellow, make sure to be honest with your customer, explain to him what happened and why it happened. this guy has got to start losing major ground if he keeps screwing up. it can be tough to do but leave him dig his own grave! Might take some time but if you do quality work at an honest price The people will eventually come round.... Just too many "BOOK JOCKEYS"

Good Luck to you, maybe someone else will have a better idea!

Hey all, enclosed are 3 links, they go to 3 .jpg images, this is a Amp from a competition builder, I don't care to much for the way it looks, no idea how it performs..... I've made this statement before!!! I'm not an RF designer or professional amp builder, I have a fair knowledge and am trying to learn more...
now that i've gotten that out of the way...

By looking at the pics and examining the way it looks, how would you guys rate the builder? How would you rate this box to the others??

This is not my box!!! I was considering buying one from the fellow that built this one! Until i saw these pics......

Here are some things i see....

1: looks like another Dave box knock-off
2: guy who assembled it is mediocre at soldering
3: craftsmanship is lacking (no pride in his work?)
4: looks like he simply copied another box, look at the height the transistors are mounted at compared to the board... if nothing else it looks crappy.... Definately not how it should be....

Builders please read on..

Now I own an X-Force amp, the inside is clean, and nicely soldered... The Chassis/cabinet is nicely done and fits well, from what i understand dave makes the chassis/cabinet portion.... I'm going to start selling one of these builders amps locally (no internet deals) I was going to buy 4 pills from a few of the builders and compare them..... you guys at home who have seen the insides of your amps drop a line, tell me how yours compares......

If any of you new/newer builders are out here reading I'm looking for a supplier who can deliver consistent quality box's without waiting a year... I know X-force looks decent, however a few comments were made about quality might be lacking, Dave, haven't tried one YET... Noname heard too many bad things......

New guys drop me a line..... Also looking for some Base box's custom built..

"none",
First, do not use RG-8M coax! RG-8M is an audio cable,
not for RF. Any coax would be better than RG-8M! While
your at it, stay away from used coax too, you're just buying
someone else's problems.
From what you are planning to have, it sounds like you
should do fine. There's no hurry to get an amplifier, wait
to see if you need it. Any radio should get you 'out' of
the state.
Good luck...
'Doc

It has a purpose. It can't be modified to my knowledge. It isn't a power house.

It's cute. :)

Put a good antenna on it.

Debbie

Message-ID: <p0L%4.102$ue.69329@news1.onlynews.com>
Source record: 38936

Good advise from all. Magnet mount antenna's aren't expensive. Unless your price range is 5 dollars.

Wilson has a Little Wil. K40 has a K30.

I recommend buying a reputable antenna. Stay away from kmart and walmart antenna's. They rust right away and you have a real hard time getting the set screws out. Forget getting replacement stingers.

Both antenna's mentioned, Wilson and k40 are under 30 dollars.

Have them tuned to the vehicle you are running them on. If you change vehicles have them checked. Rarely are they the same from vehicle to vehicle. It will work.

There are adaptors available to go into your radio without replacing the end on the coax. You might just want to graduate into a pro510 or small rig for your vehicles to get better performance.

Good luck

God Bless you
Debbie

What kind of car do you drive. I don't think you answered that question the last time I posted to your hate slurs.

You have too much hate built up. Why don't you keep telling the group how much you hate everyone except yourself.

At least you know I don't lie to my customers. The people, truck drivers, hobby talkers etc, like to have options.

What kind of computer do you use?

MMMM. These are ponderous questions.

Check and make sure you have good SWR.

That was mentioned.

If you have good swr, I have seen this and don't know why it does it, make sure that you have the antenna isolated properly from the ground. I have seen antenna's work for just a little while with the nylon washer missing. I have also see good swr and poor performance because the ground just wasn't good enough.

Lots of things to look at. Make sure you haven't broken a transmit wire in the mic.

It happens you know.
God Bless

Thanks for the input Bill, I'm pretty happy with the X-force i use,
its around a year old so i have no idea if it is representative of his
current work. I already sell the other amps, but have requests for the
competition type box and need to get into them.... start with a few four
pills..... Also you are correct on the builder, i thought i would be polite
to the builder and edited his name/logo out of the amp... It probably does
work well, however seeing his prices are a bit higher than Dave's he should
be able to improve the quality of the cosmetics..

Hey FiveDoubleDeuce, this is Triple Deuce in the Wheatfields.....Appreciate the flowers on my 8 pill.....I been hearing that a lot lately.....What kind of 8 pill are you looking for..... I make 2..... One with a lot of swing for DX purposes and one (The one you have heard about) for competition purposes..... The DX model will give you about a 6 or 700 watt dead key (on Bird) and swing 14 or 1500 or so on 16 volts.....It does a little more on a few more volts.....But you can DX all day with that low dead key.....My competition model you can just beat to death.....You can put 500 watts drive in it if you want to and put it on 20 volts and it will stay together.(I recommend staying around 18 volts with 500 watts of drive though) It will show you a dead key on a bird meter of 22 to 2500 or so.....And will run there..... Don't get too long winded in DX with this one though cause it will heat up when your running it balls to the wall.....That's for shoot-outs of course..... I'm getting $550.00 for the Comp. model and $575.00 for the DX model. (gotta put a little more stuff in the DX model to keep it swinging and running cool) Just let me know what's up....
I'll put it on you later

The setup you described with no modifications what-so-ever can talk for several thousand miles when conditions are favorable.

Using a stock (except for re-enabling the channels) Eagle Sidewinder 400 set for a 3 1/2 watt carrier with an RF Limited Power Mic and an Antron 99 antenna i have talked to over 25 different states. Also Hawaii, Austrailia, Tasmania, New Zealand, Mexico, Jamaica, The Carribean and Canada. Most of those were on AM.

Get the base of your antenna at least 35 feet off the ground...and make sure your SWR is at least down to 1.5 or lower. A Power Mic will bring up your audio and help punch through the noise...So long

Tnom,

I just wanted to comment on the 3/4 wavelength thing. Without getting into all the formulas, etc., it really is a lot of trouble to spend so much time trying to get the coax length down to the nth degree. It really won't help all that much. The guys who advise not to cut coax to certain lengths are right. As was said, the lengths we are dealing with--and I understood that this thread was about mobiles---are so short as to be a moot point anyway. It takes much more than the 10-20 feet it takes to hook up a mobile antenna to cause the losses described in other answers which may or may not affect the radio's performance. One way to prove this is with the MFJ 259 Analyzer which has the impedance meter built in. Again, as was stated, the natural impedance of an antenna at 27 Mhz will vary several points off 50 ohms. If you measure this impedance with one foot of cable or 30 feet of cable, it should be the same. Rather than trying to "match" the impedance to 50 ohms with the coax length, if you are a perfectionist, you can do it with a Silver Mica Capacitor at the base of the antenna, OR you can wind a few turns of wire into a coil, placing the bottom of this coil in series with the antenna mast, and "shorting" a wire to ground from this coil. By touching or clipping this wire to various turns of the coil, you can bring the antenna's natural impedance onto 50 ohms. This is done with lots of Ham HF antennas where the natural impedance of the antenna is much lower than at 27 MHZ---more on the order of 12-17 ohms. This is in the case of highly efficient antennas like the Texas Bugcatcher.

One last thing: Lots of times a "broadbanded" antenna isn't necessarily the best. There are a number of reasons an antenna might be broadbanded. Again this isn't as critical up on 27 as it can be at lower freqs, but it still applies. For example, an antenna may be broadbanded simply because the loading coil is inefficient. Antenna impedance SHOULD be highest at the feedpoint, but if the most resistance is up in the loading coil, then it is a sloppy radiator. True, the TOTAL impedance may be near 50 ohms, but it is in the wrong place.

Anyway, the place to get the most out of a mobile antenna system--or any system--is AT the antenna itself. Fiddling with coax length, whatever benefit there MIGHT be is not the way to do it. I won't attempt to argue such benefits, indeed, I believe there are none or next to none. That is my opinion, but is based on 30 or so years of messing with antennas--and a few textbooks, too. AS you say, there COULD be some benefits, it's just that in those years I have never found them. LOL!

Just a recommendation,USE Timewave LMR-400 great velocity factor great
shielding.
Forget the amp do it barefoot! Why amplify garbage anyway. Not to mention
its illegal!

I have talked by pure accident to Europe on 27mhz @ 4 watts pep.

> broader. The reverse could happen if the output of the radio was 40 ohms

The radio impedance does not affect the SWR. This, alone, is no reason
for the SWR to appear broader. The output tuning could affect the
proportion of harmonics in the transmitted signal which, in turn, could
affect the SWR reading but that is a different topic.

The only way a transmission line makes the "SWR bandwidth" appear
broader is by virtue of losses. The more loss you coax has, the better
the SWR reading will look. In this respect, 3/4 wavelength of coax
could yield a lower SWR reading than a shorter length. But the reality
is that the match is not improved. No additional power is being
transferred to the antenna. In fact, less power is transferred because
less power is delivered to the antenna.

In a nutshell, there is no benefit to cutting your transmission line
to 3/4 wavelength or any other particular length. However, there is a
benefit in keeping it as short as possible.

Bummer! I guess I haven't been keeping up with the latest parts trends.
I always prefered the stud mount parts, as they were easier to use when
fabricating into mod projects.

That's all any part manufacturer does when they "match" a pair. They
just select 2 (or more) deviced with similar gain and leakage numbers. I

was just unaware that you could select between "ranges" of device specs. Of course, other than 455's and 454's, I don't use many Motorola devices these days....

When trying to "soup up" a stock radio for max available power, we try to get the highest gain devices, for the most power out, since we are not usually in danger of overdrive in the lower level stages of the transmitter. Amps are another story, since they can be unstable is poorly designed. The right design can be stable even with higher gain devices. But that usually costs more.

Absolutely! And for they type of "clean" running that I do, that 36 watts is fine for even 4 device amps.

> for DC.

That's the tact that I try to take as well. I prefer to leave the radio alone, with only minor "optimization", and let the amp do the work. That way, if you do happen to pop the amp, at least you still have a signal with the barefoot radio. If you fry a "turbocharged" radio, you have no signal.

> analyzer.

Their (customer's) loss I guess. Since I do (did) a lot of SSB work, the people that I deal with insist on clarity. Thankfully, these people also understand that trading off a few watts for a ton of distortion, is a worthwhile trade. I am lucky that I was able to score my spec analyzer from my company when they "wrote it off" as obsolete. It works just fine for what I use it for.

I'm a little leary about setting the bias too high, after some early experiments (back in the 70's) resulted in fried finals when the bias was set too high (remember the initial 858 boards?). I tend to set bias by the scope and the 2-tone test. Once I see the distortion go away, I don't go any farther as it is really not necessary.

I agree that 100 ma is not unreasonable for a 455. I felt a little safer at 85 ma.

But you said that your EZNEC calculations showed that "The odd
multiple line length shifts the SWR null point up in frequency."

I see no SWR points changing. How can you agree with this math
that contradicts your claim?

I'll say you're not done yet. You need to explain how you derived
such a conclusion from your EZNEC numbers. You already backpedaled
from your original conclusion that EZNEC showed a broadening of the
measured SWR at the radio. Looks like it is time for some more
backpedaling. Maybe you should quit now before you dig a deeper hole.

"Stupid is as stupid does". You should "inform" potential customers of this jerk and then let THEM decide if they wanna get screwed over.This can be done without actually "bad mouthing" the guy (altho it sounds like he SHOULD be bad-mouthed).If your friends then decide to go ahead and take the chance of this fool ruining their equipment, at least you TOLD them so.You have a clear conscience:can say "I told you so", and maybe the "word of mouth" will THEN get this moron shut down.Remember..."A diplomat can tell someone to go to hell and make them look forward to the trip".Best Luck ! (Thank God there ARE still honest folks in the world!)A+++++++ (<:

I had a TS600V that I sold to a person in Maryland ??? I can`t remember exactly where he was from. From the conversation I had with this person I gathered that he was a screwdriver expert. No disrespect intended.
While I owned the unit it seemed to work rather well on am and had no swr problems. I can`t remember correctly but I think it keyed around 500 watts with a 4/5 watt drive. (It`s been a few years)
I got the thing from Two Way Electronics I think.
Don`t know if this helps, but at least I threw my 2 in.

Uniden PRO 510XL

I'm thinking of selling this great little radio. My fiancee doesn't want it in her Neon anymore... :(
It'll be great for 4x4 trips or around town. It's in good shape. I'd keep it but I've already got a good mobile in my vehicle. It comes with a little magnet-mount rubber ducky antenna. I'll take $40 or best offer.

Unfortuantely, you are correct. I happen to be a licensed amateur (WB2OSP, WA3RJX, N2JH, currently AA2QA) - but my only 'rig' is a 440 MHz HT. I do enjoy some of the CB sites (especially 'soda pops' site) - but I assure you it is not with a 'holier than thou' attitude. I used to have a ton of fun bunny hunting with CBers back in the '70s.

When I was in the service, I went to join one ham club on base - there were 3 dour faced guys who handed me a list of their club regulations. Hmmm... I said I'd stop by later. On my way down the street, there was a sign reading '73'. What's this? I went to the back of the building and there was a large group of men AND WOMEN (OK!) having a barbeque. I was told it was a CB group and I only needed a license (you had to have a license back in those days)to join. They offered to help me get the ticket (I kept eyeing the barbeque) - so I pulled out my 1st class radiotelephone license. Instant membership! I fixed a couple of rigs on the spot and was handed some ribs and beer. I had a ball with that group, but was shipped out a week later for Bainbridge Md for a school followed by a tour on Guam then on to Vietnam. It isn't the license or technical knowlege, the CBers knew how to be decent human beings and have some fun.

I think the difference between the two groups (hams and CBers) on that base pretty much said it all. I haven't seen much difference since then. Whether hams or CBers, however, there is a certain mentality of the type who like to intentionally jam other - one which I do not appreciate.

Other than that, just try and have a little patience for the 'mentally impared'.

Best 73s,

Jim (AA2QA)

>But you said that your EZNEC calculations showed that "The odd
>multiple line length shifts the SWR null point up in frequency."

Yes I did.

>I see no SWR points changing. How can you agree with this math
>that contradicts your claim?

The math conforms to the theory, but it does not conform to my own
eyes of which I trust more.

>I'll say you're not done yet. You need to explain how you derived
>such a conclusion from your EZNEC numbers. You already backpedaled
>from your original conclusion
>that EZNEC showed a broadening of the
>measured SWR at the radio.

Backpedaled? No, I had the guts to admit that I filled out a field
within EZNEC incorrectly. Again with the field filled out wrong it did
show this. I would hardly call that backpedaling. It would be much
more accurate to call this mistake and VOLUNTARY admission of it
as a correction. Not backpedaling.

>Looks like it is time for some more
>backpedaling. Maybe you should quit now before you dig a deeper hole.

I would like to see you backpedal on your statement that backpedaled.

5217. CB - Linear Question

Newsgroup: rec.radio.cb

Can the RCI 2970hp radio be fed into a Texas Star 350HDV ?

The specs on the 350 states 4 watts in with 180 out or
20 watts in with 350 watts out.

Can I reduce the RF gain on the 2970 in order to have a lower
output into the 350 and have it work ?

The 2970 does have the built in amp and I was told it cannot
be done as it may damage the radio.

Hello Killrwatt: You saw a:
"Mark Invader/sidwinder export 23 high power base uses 2 6lq6"

Was there really a verison of the Mark Sidewinder made with 2 6LQ6 tubes as a finial RF amplifer? I've only seen two Mark Sidewinders, one at Woodys web site, and I have one.
And they used 6BQ5 tubes as finials.

My understanding is that their thermal efficiency isn't
as good as the flange mounts. That made them less
attractive to manufacturers. The rest of the story is
just the natural order of things: sales drop to the
point where they are no longer a profitable line, and
production ceases.

> these days....

Low gain 454s are a good sub for hot 2290s. And, if
the customer won't snivel about the loss of output,
low gain 455s are a good sub for hot 1446s.

It's a cost the designer/manufacturer has to bear initially
by putting forth the time and effort needed to develop such
a design. Another variable is the experience and education
of the designer--which is often inadequate for the task at
hand regardless of whether or not they are willing to put
forth the time and effort. I've seen many CB amps where
the designer had some obviously misguided ideas. I chalk
that up to the fact that CB amps are contraband, and that
knowledgeable RF engineers are unwilling to be involved in
their developement.

I agree completely. I see two device amps all the time
that slowly developed failures over time because they
were constantly being moderately overdriven by a tuned-
up export rig or 10 meter monobander. Slowly but surely,
after paying for 2 or 3 repairs and hearing my speech
on how they really should be using a 4 device amp in
their application over and over, most customers will
finally upgrade.

That's exactly right. I'm glad you said it. I hope
some of the guys out here that think life is only
worth living if their 29 or 2510 makes 55 peak watts
understand what you just said.

I checked a 2510 schematic and a Jackson schematic.
The 2510 has feedback on the driver (.001 and 330
ohms), but nothing on the final. The Jackson has
no feedback on the driver or the final. That's
surprising since the 2510's heatsink is at chassis
ground and the Jackson's isn't. I use a Jackson
myself as a mobile and a backup for my base Kenwood.
I'll have to throw it on the spec-an and see how
it stacks up. I may add some negative feedback to
it just to clean it up and increase it's reliability
in a high-power mobile environment. It's an oldie
and it's still on its original 477. I'd like to
keep it that way.

> for what I use it for.

I use a cheap one that has no tracking generator
(ITC Instruments SA1000) which makes finding the
center frequency kind of a bitch, but it's a helluva
lot better than nothing.

> I'm a little leary about setting the bias too high, after some early

> don't go any farther as it is really not necessary.

I agree. I've made many an amp work better and
become more reliable by taking the time to improve
the biasing. Most CB amps that are biased are
overbiased. With amps, overbiasing causes as
much or more spurious emission than underbiasing.

It's very common for guys to crank the bias up
in order to get a few more watts. Of course,
in a properly designed amp stage where the drive
is adequate and the devices are not loafing, all
the "screwdriver wizard" is doing is setting the
radio up for a failure. However, I figured
since the 455 in your example was stable and
loafing, you might go with more bias in order
to pick up the 9 lost watts. I suppose that
customer either isn't a hardcore meter fixater,
or you convinced him that the loss was negligible.

> I agree that 100 ma is not unreasonable for a 455. I felt a little safer
> at 85 ma.

A neat experiment would have been to see just
how much bias would have been needed to get
the output back to the 477 level, or, to chart
the effect of changes in the bias level on
peak output power. Changes in bias have a
very noticeable effect on small signal gain.
A 2166 driving a 455 means the 455 will always
be running in the "small signal" input range

where changes in bias have the largest effect
on output power. It would be interesting to
see the difference in output over the range
of say zero bias to 500 mA. It's not uncommon
for 211-07 and 211-11 case devices to be biased
that high in hard driven linear amp circuits.
The original (EB63) is a good example. They
ran the 454s in that circuit at 500 mA each.
They claimed that that's what it took to lose
the crossover distortion at the higher output
levels. In your example, the 455 is running
easy. So, if it takes 2 or 3 hundred mils
of quiescent current to match the 477 power
level, it's not likely that the reliability
will suffer for it--especially if the stage
is stable. I'm half-tempted to pay the ransom
for a Uniden Lincoln Service Manual just to
see how they approached this change over.

You know alot of the guys that are going to
do the change over or pay techs (like us) to
do it are not going to want to eat a decrease
in peak power. It would be nice to know that
at least the guys with 477s could have equal
performance if they are willing to accept the
possible reduction in reliability. I really
doubt that the 455 could be pushed to the 497
power levels no matter what, so those guys
will have to eat it or experiment with low-
band VHF devices like SD1446s and SRF3800s.

I agree. Tech talk written by people that know
what they're talking about is what I'm here for.
Unfortunately, the knowledgeable tech talk has
all but disappeared from this newsgroup. The
people that benefitted from the technical ex-
changes of 2 or 3 years ago should consider
themselves lucky because days like those will
probably never return.

"Larry (OH)" wrote:
>
> Does anyone know any thing about a Silver Eagle 200 mobil unit.

Yes.

> Are they any good and are they still made?

They are okay for AM-only use if you
don't mind using a dirty, unstable
amp.

The 200 and 350 are cheap 2-pill and
4-pill TNT boxes. Personally, I like
the 350 more than the 200. The 350
actually has some "kick" to it while
the 200 is just another crappy 2-pill
that really should be a "modulator"
for a good 4 or 8 pill box. These
days, you need a cheap 4-pill just
to be "in the mix" on the popular
channels.

Around '94 and '95 I was selling 200s
as cheap "get your feet wet" amps.
I was getting them for $55 from H&Y.
Today I don't think they're worth any
more than that--but you won't get one
for $55 anymore.

Compared to the low-cost 2-pills and
4-pills I sell today, I think the
Silver Eagles are shit. I'm glad I
don't have to sell that level of
product today.

If you're going to buy a crap amp,
buy a 4-pill (will say 350 or 400)
on the front. If you want a decent
2-pill, buy a Blue Face (will say
Palomar, Galaxy, Magnum, or Skipper
on the front) or a Texas Star.

> Are they solid state or tube type?

They are solid-state. There are no
mass-produced, low-power tube mobiles

made anymore.

Expose him and make him defend himself to us.

For all we know, you're the hack and are simply
envious of him. This could be your way of lashing
out at him. Who are we to know? I'd like to hear
his side.

12V or 13.8 Volts, basically the same. When your car isn't running it is 12V and when the alternator is turning it is 13.8 Volts. Like the other guy said, just buy a small power supply (2 or 3 amps) and your off and running.

since no one wants to answer your question...
175 watts shouldn't make your engine sputter much less kill your computer.i am running 150 in my 81 vw and it causes no problems with either my computer or my charging system.i had 600 watts in my neon and all that did was kill my alternator after 8 months or so.take your alternator to a parts store that has a tester and get it checked.could also be your voltage regulator(electrical spikes would probably explain the dead computer too.)or even too small of a battery.

Let's see if it goes above $350.

H&Y wants $550 plus shipping (probably $25)
for a new one.

It's a 4 on a 1 to 10 scale.

> How would you rate this box to the others??

Like you, I can't rate the performance--only the
appearance.

> This is not my box!!! I was considering buying one from the fellow that
> built this one! Until i saw these pics......

The front panel pic makes it pretty obvious.

There is a guy out here who goes by "Train"
and he supposedly builds amps.

> Here are some things i see....
>
> 1: looks like another Dave box knock-off

More like a Cookie-Built knock-off box.

The output transformers are small and not
Dave-like.

> 2: guy who assembled it is mediocre at soldering

The soldering isn't that bad. Based on what
I see in the pics, I think the amp works fine.
It just looks crappy.

> 3: craftsmanship is lacking (no pride in his work?)

Maybe. I don't think it's pride--I think
it's more like complacency.

> 4: looks like he simply copied another box, look at the height the
> transistors are mounted at compared to the board... if nothing else

> it looks crappy.... Definately not how it should be....

A number of the "comp" amp manufacturers use
solid copper boards that are at chassis ground
and need to be right up against the heatsink
since the heatsink is also at chassis ground.
In other words, it's not unusual to see the
transistor legs (or leaves) bent down to the
board. It doesn't seem right, but it doesn't
seem to effect the performance or reliability
of the amp.

> http://www.angelfire.com/scifi/thepage/amp1.jpg

>
> Now I own an X-Force amp, the inside is clean, and nicely soldered...

For the most part. Blue Faces and Pirates are
every bit as clean (or cleaner) than X-Force.

> The Chassis/cabinet is nicely done and fits well, from what i understand
> dave makes the chassis/cabinet portion....

That's not true.

> I'm going to start selling one
> of these builders amps locally (no internet deals) I was going to buy 4
> pills from a few of the builders and compare them..... you guys at home
> who have seen the insides of your amps drop a line, tell me how yours
> compares......

For maximum profit look into Pirate. Pirate (Steve)
kicks ass price-wise and produces a clean looking
product (if that's a big interest to you).

> If any of you new/newer builders are out here reading I'm looking for a
> supplier who can deliver consistent quality box's without waiting a year...
> I know X-force looks decent, however a few comments were made about quality
> might be lacking, Dave, haven't tried one YET... Noname heard too many bad
> things.....

The right supplier for YOU depends on what YOU think
is important in a box. If YOU don't believe in what
YOU are selling, YOU will never do well selling amps.

> New guys drop me a line..... Also looking for some Base box's custom
> built..

The best value and profitable line of base boxes
right now is probably the X-Force line that Dennis
(#12) had a hand in.

Mobile amps are the staple of any amp dealer.
You'll have to experiment there to see what
you like and are comfortable selling. X-Force
and Dave are nice, but they're too expensive.
Since I like to think I'm an amp tech, I do
better with Pirate because if need be I can
improve his product to where I'm comfortable
selling it. If you know nothing about amps,
sell Dave and Texas Star. With those you
personally won't have to know anything.

Good luck.

You can turn the 2970 down so it'll properly
load the 350. The problem is that you're
running a radio that already has a 2-pill
amp built-in into another 2-pill amp. You
have to be very careful not to overdrive the
350.

And, it's not the RF Gain that needs to be
lowered--it's the RF Power. You should have
a tech remove TR32, and look into getting
a bigger amp. That radio will adequately
drive an 8-pill amp (like a Texas Star DX1600).
Using that radio to drive a 350 is basically
redundant since the radio already has a 2-pill
amp in it.

I hope this helps.

You have to turn the radio off before you disconnect it from
its 12 volt source. If you don't, you lose the memory. That's
how they work. It's Midland's way of saying "don't spike this
radio with DC power."

Due to minor manufacturing errors, the IF filtering is defective - can be
fixed to improve performance. But, cost-cutting has reduced the RF filtering
to almost useless. Will work fine across town, and will expand to cover 26
thru 30MHz, but will be disappointing as a DXing radio

Pirate doesn't use 2290's for drivers. It does sound like a Pirate that someone changed out the driver (originally a 1446) for a 2290.

5247. Re: Antenna Question ABS 1600

Newsgroup: rec.radio.cb
Date: 2000-06-09 00:00:00 UTC
From: BLY <bly213@nospam.att.net>
Message-ID: <4ZY%4.1696$yA5.108767@bgtnsc05-news.ops.worldnet.att.net>
Source record: 38970

Hello, I was wondering if this ABS 1600 antenna is the same thing as the old "Big Stick" antenna
from 10 to 20 years ago? Reason I am asking is because I have an original Big Stick made
by Shakespeare up on my roof installed 13 years ago in 1987. I have not used it at all in all
those years and just recently decided to jump back onto the CB for shits and giggles as well as
curiousity of what the band has turned into these days.

Anyhow, I have a very high SWR about 2.7:1 reading with that antenna now. I thought it might be my cable
but I replaced it and it actually got worse 3:1 ! So I suspect that the antenna has seen its better days.
Too bad I hardly ever got on the air and used it. I liked the Big Stick because it was just that, a big straight
long antenna stick without those messy radials. I see SolarCon (Antron?) have antennas out now that
are like the Big Stick was. But then I also see the ABS 1600 antenna by Shakespeare that seems to be
like a Big Stick.

So for all you "up to speed" folks out there, what's the story on this ABS 1600. Is it a Big Stick or is it
a better improved Big Stick. One thing that already is bothering me though is why my original Big Stick
antenna has developed a high SWR after 13 years sitting. Shakespeare seems to brag about their strong
Mil Spec build quality and claims their antennas will last. Hmmmmm, hype or not?

I was eyeing the Solarcon IMAX-2000 but read in this newsgroup somewhere that they are not
sturdy antennas and were having problems with them cracking and or breaking on people! So
I think I am steering clear of the IMAX-2000 for now unless they have fixed the problem by now.

I would guess that the exact same part is used in the Uniden GrantXL.
Out of production, but there are plenty of parts around, I'm sure.

Keep in mind that AM signals have a steady carrier and the modulation will increase & decrease the amplitude of this carrier. Depending upon where the diodes start to conduct will have slightly different effects. Silicon diodes turn on at about 0.6V (germanium at about 0.3V and schottky at possibly more or much less). 0.6V of RF isn't a lot. It will clip the output quite severely and generate lots of even-order harmonics. Ie: 54MHz, 108MHz etc. These harmonics will be very potent too. The tuned circuit of the antenna will for the most part fill in the gaps in the signal and it will transmit a carrier but it'll be very abusive on the output stage of the radio. Radios like to drive into 50 Ohms, and a pair of back-to-back diodes shorting out the output stage will present appreciably less than 50 Ohms. I like to encourage people to experiment with electronics, but I don't know that you'll be able to do this experiment without damaging anything. :) The key thing to remember is that any non-linear transfer (like a diode) will result in distortion. The configuration of the non-linearity will determine if the harmonics are primarily even-order (in this case) or odd-order (like in a push pull feedback style amplifier).

The guitar pedal works in the same manner but in music even-order distortion products are more -musical- than odd-order. Some of the older guitar pedals were purposely designed to generate odd-order harmonics. I think the Fuzz Face was one of them. The sound is definitely different - but only really suitable for playing a rather grungy lead. When you play chords through it the sound is very dissonant.

Good radio - difficult to modify. Modified versions I've seen had a PLL
that was completely replaced. Sadly, this decreased the stability of the
radio and made the synthesizer noisy. Another modification I've heard of
include changing the loop mixer crystal. This will still skip a number
of channels though. The radio can be modified for a two-way clarifier
without too much difficulty.

Wiring a 240VAC outlet is a cinch. You plonk in two new breakers in your fuse box, say 15A each, one off of each of the two 120V circuits, attach your black wire to one, white to other, and run these into a 240VAC receptacle. 240V receptacles look like the regular -scared-looking-dude outlets but the eyes are horizontal instead of vertical. They fit in the standard box and come in configurations of one or two outlets per. Hope I'm not being too technical here. :)

Power supply? If it's linear, it's probably an LM723, 723 or M1723. This IC has been in production since about 1973. It's comprised of a current source, voltage reference, high-gain amplifier, current limiter and compensation/remote shutdown circuits. Very versatile.

What brand "adapter" is it? If it can handle around 10 amps then you are fine!! The radio will not pull this many amps but it is nice to have it when you are on SSB. Of course SSB uses only 50% duty cycle as it is.

Larry why bother cross posting your sarcastic crap to the CB newsgroup??
The linear itself is not illegal, using it on 11 meters would be illegal, He never said he was using it on 11, for all you know it may have been a legitimate question from a legitimate Amateur operator.....

To: FIVEDOUBLEDEUCE@webtv.net (BAYOU COUNTRY) Subject: My Box is better than Davemade and X-force??
Hey FiveDoubleDeuce, this is Triple Deuce in the Wheatfields.....Appreciate the flowers on my 8 pill.....I been hearing that a lot lately.....What kind of 8 pill are you looking for..... I make 2..... One with a lot of swing for DX purposes and one (The one you have heard about) for competition purposes..... The DX model will give you about a 6 or 700 watt dead key (on Bird) and swing 14 or 1500 or so on 16 volts.....It does a little more on a few more volts.....But you can DX all day with that low dead key.....My competition model you can just beat to death.....You can put 500 watts drive in it if you want to and put it on 20 volts and it will stay together.(I recommend staying around 18 volts with 500 watts of drive though) It will show you a dead key on a bird meter of 22 to 2500 or so.....And will run there..... Don't get too long winded in DX with this one though cause it will heat up when your running it balls to the wall.....That's for shoot-outs of course..... I'm getting $550.00 for the Comp. model and $575.00 for the DX model. (gotta put a little more stuff in the DX model to keep it swinging and running cool) Just let me know what's up....

5261. Professor's AMP does work...

Newsgroup: rec.radio.cb

Hey, just a note to the NG, Professor's amp works great, and I know that many will not believe me, but I live near the Professor, and I met the Professor on the air, and he is a cool old cat.....

(He has better things to do than be on the radio 24/7 to impress you asses..)
But in my opinion, he made a very thorough amp that kicks ass, (for a 1 pill..)

Now in terms of power, a 1 pill is small for my tastes, but he did do a good job designing his prototype in which I call, "Jalapeno" ... Not too hot, not too mild, Just spicy enough....

G-Man......

>The radio impedance does not affect the SWR. This, alone, is no reason
>for the SWR to appear broader. The output tuning could affect the
>proportion of harmonics in the transmitted signal which, in turn, could
>affect the SWR reading but that is a different topic.

Of course it does not effect SWR and I never said it did.

It does effect the impedance match beteween the radio and the impedance seen looking into the transmission line.

>The only way a transmission line makes the "SWR bandwidth" appear
>broader is by virtue of losses. The more loss you coax has, the better
>the SWR reading will look. In this respect, 3/4 wavelength of coax
>could yield a lower SWR reading than a shorter length.

No there is another way, by more closely matching the impedance of the load to the radio.

But the reality
>is that the match is not improved.

The match can be improved but the SWR has not changed. SWR and impedance match between radio and load are not the same. Swr is a functin of load impedance and line impedance. Impedance matching is matching the impedance of the radio to the impedance of the load as it is transformed by the transmission line. Better match equals more power to the load and broader apearing SWR ratio. In this case the SWR meter is not really measuring SWR, it is indicating match between radio and load which is really more useful than knowing the SWR.

No additional power is being
>transferred to the antenna. In fact, less power is transferred because
>less power is delivered to the antenna.
>
>In a nutshell, there is no benefit to cutting your transmission line
>to 3/4 wavelength or any other particular length. However, there is a
>benefit in keeping it as short as possible.
>
>
>
>
>
>

If the extra 1/4 wl of coax acting as a transformer actually improves the match between the antenna and radio the match will in fact be broader. If the impedance of the radio is really 50 ohms and most peaked and hacked CBs aren't

then the 1/4 wl section will not help.. If the impedance of the radio is actually graeter than 50 ohms the 3/4 wl line would give a better match to the radio. If the impedance of the radio is less than 50 then the 1/2 wl cable would be a better choice. OF course none of this changes SWR but it does change the load the radio sees which is really what SWR meters measure. Better match will appear as a broader match.

I use a CB linear on 10 meters, so what does that prove??? you insinuate
because i post in a cb group and use a colorfull name that i'm not a ham or
i'm someone that crawled into HF because of the restructuring?? Got news
for you, i happen to hold an Extra class ticket and i even did my 20 wpm!
so blow it out your POMPASS ARSE! Your mentality is the main reason such
drastic measures were taken regarding restructuring. You think because your
a ham your better the average Joe. your attitude drives off new and
potential Hams! why criticize every move? why not Attempt encouragement?
My mistake, you have no intention of being a HUMAN BEING! Your just
another DAMN TROLL

When Hams come to realize they are no better than
any other group of radio Hobbyists then, and only then
is there a possibility of saving the Amateur Radio spectrum
from commercial interests! Good folks disregard this post!
you holier than thou Stuffed shirts get off your high horses
and wake up!

No, It is not illegal to use a 13.8 volt 3-5 amp DC Supply to power a radio. that is what it is made for. It is illegal to use an RF(radio Frequency) amplifier known as a linear on CB Band. but most people ignore that rule and run them anyway.

As your reference to "Train" I know him personally. I don't know that he builds amps, but he is definitely competent to do so, he is the person who peaked and tweaked my radio a few years ago. Him and his wife are good people. I would recommend anything that does works on, My radio sounds great and works great thanks to him.

If I have said it once I will probably end up saying it a thousand times, One of the better radios to start with would have to be a Uniden Grant XL Runs about $150 and is worth every penny. Nothing wasted, and B.S. gadgetry. Just good old fashioned solid state radio. It can be modified, and improved nearly to your hearts content. It is a good clean sounding radio (provided that the person peaking & Tweakin knows what to do and Not what to do). Like G-man said the antenna and SWR is key!! The worlds most expensive radio won't do any damn good if your antenna and SWR's are not set up right. Run your power FROM THE BATTERY!! Remember to put an inline fuse in your positive lead. Plan your installation, as far as power wire routing, radio mounting and placement, antenna mounting and placement, and your coax routing. Take your time and plan it out and do it right from the beginning. If you don't know....ASK QUESTIONS!! Most people here will help, and give a little grief....LOL. Other than that and most importantly, LEARN, PLAY, AND HAVE FUN. And don't forget....Respect others.

My post did nothing to take away from his competence, I stated i have
no idea how his amplifer performs, even added probably works fine, I did
attempt to keep his identity out of my post, but obviously did not do a very
good job. I wished to compare the builders skills with the skills of
others, I won't buy one of his amps because they are to "rough" looking
for the price he charges... I would suggest he work on improving the
cosmetics of the amps! He may be on par with the other competition boxs
performance-wise, however I could not Sell the amp looking like it does at
the price i would need to get...

That's not true. The proof is in the old, standard
equation that states a 100% modulated signal increases
in average power by 50% over the unmodulated value
given that the modulating audio is symmetrical.

> The amplitude for the carrier at any given instant along the
> crest does. So you are technically correct in saying the carrier does
> change size, but not average power.

Using an RF ammeter will prove the old equation
to be true and your statement to be wrong.

As for what kind... I prefer a Wilson1000 for convienience and good performance.
As for location... the center of the roof is the best place for any antenna you choose. It allows for the greatest height and minimizes directionality that would be caused by mounting closer to the corner of the vehicle.

Speaking of the carrier, as I was, it is true. You have six watts
total, but four of them are the carrier. The other two, the
sidebands.

>> The amplitude for the carrier at any given instant along the
>> crest does. So you are technically correct in saying the carrier does
>> change size, but not average power.
>
> Using an RF ammeter will prove the old equation
> to be true and your statement to be wrong.

I am not wrong. Notice I said "instant" Take a snapshot of the area
of the waveform that is in the valley of the modulation crest. It no
longer has even the original four watts of carrier power.

It probably is but

The relay itself has nothing to do with it. This is a total waste of a
switch and a cap. You do not need these parts for a rec amp.

No... you do need a relay for a receive amp to switch the amp "out" on transmit!

Doesn't really matter... what matters is that if you do... your signal will be somewhat directional towards the greatest mass of metal (ground plane holds the signal down on the horizon)... in this case... towards the vehicle front.

it would be best to take it to a shop and let them check it
out...I don't know about other shops but I don't charge for that
in my shop.....treat um right and they'll come back..

I agree, but Hillbilly said " it has a am/ssb switch because it has a
relay in it" The relay does not require a AM /SSB switch to operate
satisfactorily for pre-amp purposes.

not needed but i'm not sure if you want a chattering relay.... guess you could do what some folks do, keep a noisy fan running to maintain a little output on ssb so the relay does not kick out/in....

Without any power, a small quiet relay could be used. You probably
would never notice any noise.

Situation:

10 meter use by a licensed ham. "CB" linear (Palomar, Texas Star, etc)
Is it legal or not for a licensed ham to use one of these "CB" linears on
10m?
Driven by an HTX-100 or other "Type approved" 10m transceiver.

----- Original Message -----
From: Radiskull <Radiskull@usa.com>

> you idiot. CB Linears on 10 meters is Illegal.

Wrong! first what is a CB LINEAR???? typically a couple of transistors
with broadband i/o circuit, possibly more transistors using i/o
combiners.... Per FCC rules and regulations i'm allowed to make and sell
these amps, I believe the legal number is two per year, I'm also allowed by
law, to run UP TO 1500 watts. My mobile will run full legal limit on 10-160
my amp is a rebuilt solid state CB amp it is clean and DOES not splatter!
Just because i have it does not mean i use it, i very seldom throw the
switch! You sir are not only a POMPASS A$$, but an ignorant one at that!
I doubt your even a real HAM, and if you truly are I'm ashamed of you!
You've truly lost the spirit of amateur radio! But perhaps your just one
of those fellows who enjoys QRM'ing evryone!

You ignore FCC regulations
> and laws on 10 meters doesn't show that you will abide by any law or
> regulation on any other band

I ignore nothing!!! Again you are simply ignorant!!!!

-- why bother with the flames? you KNOW that we
> all Know what cloth you are cut from -- crawl back into your own sewer.
> 10-4.
>

Do tell, What cloth is that??? If you were representative of a
typical HAM i would be ashamed to be cut from your cloth!!

> and it is pompass ASS you bloody arse!
>
>

Politeness and integrity prevented me from using your version! something
you probably know little about!

You are quite simply an ignorant person who wishes to be in the
limelight, lacking any real communications skills you are simply venting
your frustration on the NG....

There is absolutely nothing wrong with the vast majority of CB
operators, just like Ham radio CB has its "Radiskulls" should be
"Numbskull" You and like minded people are the typical reason why MANY CB
operators will NEVER becom Hams!!! Now i'm sure your first thought, or

response will be "GOOD" however many CBers would be a great asset to
Amateur radio, and i would glady take 10 of them for every "RADISKULL" on
the Ham bands!!

Have a nice weekend!

Source record: 39098

Hello None: The Radio Shack 3 to 5 amp power supply is legal. The 13.8 volt output will drop a small insignificant amount of voltage when in use, especially when you transmit. Some car and truck electrical systems can have a engine running voltage as high as 14.5 Volts DC. So 13.8 VDC is not a big deal.

There is nothing in the FCC rules that says you can't use a external power supply, its done all the time. The FCC rules say you can't use a external linear amplifier, that increases your transmit output power. But many people still do.

Jay in the Great Mojave Desert, just down the road ah ways from the fillin station.

That's usually the case. Although, with all the radios made that were using 477's, I found it surprising that they discontinued them. I guess that even the brisk 10 meter/export radio market wasn't enough for the total picture.

Yes, I would agree that the fact that CB amps are illegal, almost precludes any legitimacy in designing. While there are some really talented RF guys out there, they lack the resources to productize their creations in a manner consistant with what a large company (with a staff of engineers) could do. Still, there are some amateur solid state HF mobile amps out there that would make an great example of what a good design was, and hopefully someone will copy it, without "muntzing" it to death to save a few bucks.

> > finally upgrade.

It never fails to amaze me how someone could take an amp that was
designed for around 8 watts peak drive, and drive it with 40 watts peak,
and then are surprized when it sounds like dirt, and isn't reliable. But
much of that happens because of the wealth of "misinformation" available
out there from the many people that "know a little".

> > > > That's the tact that I try to take as well. I prefer to leave the radio

Unfortunately most won't. If they did, they'd never insist on those
"turbo" mods in the first place. There are a (very) few cases where
someone wants the most signal that they can get out of the radio,
because, for whatever reason, they can't run am amp. I can understand
those guys somewhat. On the otherhand, there are high power export
radios available that are made in the factory to run at higher power
levels. I would think that they would fit the bill, and be more reliable
as well.

Ok, I thought I remembered seeing some feedback. I was probably thinking
of the 2510 (and the driver stage at that). There are many similarities
between the Jackson and the 2510's transmitter. The Jackson gets my vote
as one of the best export radios out there. Much more stable and
reliable than the Galaxies, sounded great on SSB, and put out more power
than the dual final radios. Some people do not like the fact that the
Jackson is a "low level" modulation scheme, but from the scope's
viewpoint, it doesn't look any different from a "high level" radio, when
properly set up. Of course, if you primarily use it on SSB or FM, that's
a moot point anyway.

Mine is an old HP 141T (weighs a ton), and the frequency scale is not
accurate, but I have a frequency counter for that stuff. As long as the
amplitude is calibrated (mine is about 8 years out of factory cal, but
I'm sure it's still close), I can get meaningful information from it.

> or you convinced him that the loss was negligible.

Well, in all truthfulness, when the bias was adjusted, I saw very little
change in power output. I know, for instance, in the 2950, the driver's
bias makes a BIG difference in output, but on many radios, the final
output bias can have little effect of power, but it has a big effect on
how hot the heatsink gets.

This customer is somewhat of a "meter watcher", but he's learned alot
from me over the years, and he agreed that the fact that this final will
probably outlast the rest of the radio, was worth the loss in power
(until he finds another more "creative" way to fry it).

I'm curious as well how the factory adapted the 455 into the radio's design. Let us know what you find if you decide to pursue it.

I am also a bit curious why I didn't see an appreciable difference in output power through the bias pot's range. I'm thinking that the bias circuit simply could not source enough current to get a meaningful range.

Well, my experience has only been with that one radio and that one device. If I ever get the chance to do it again, I'll make a more careful note of what's going on, and hopefully, I'll experiment a little more. I agree, that people will not want to sacrifice watts, without a good reason. The reason that I usually give is "it's that or nothing", since the original parts are generally not available, unless you're willing to pay 4x what they were worth to the few guys that still have old stock.

Many of the more knowlegable guys have simply lost interest, or have just gotten tired of endlessly defending themselves against the "technobabblers". I'm still bummed at what happened to Dennis (#12). I miss his input, and the guys responsible for doing what they did, just removed a great source of radio knowlege which could have benefitted many people. I hope they're happy. My own interest in CB has diminished greatly in the last 8 or 9 months, due to a move, and the skip levels, which annoy me to no end. I am also getting tired of the ham bashing, RF police, and general flaming that seems to have gotten out of hand here as of late. I have more of less backed up into lurking status, until I see a post that involves interesting information that is worth discussing, or answering a specific question that I have personal knowlege of.

Dave

Since when would a "CB" linear used on the 10 meter band by a licensed
ham be illegal?

I dispute this "broader appearing" claim but this is a trivial issue and
I'm not going to get into it. I understand your main point and agree
with it.

> In this case the SWR meter is not really measuring SWR,

I don't know how the SWR meter would not measure SWR but, again, this is
getting off on a tangent.

> it is indicating match between radio and load which is really more useful
> than knowing the SWR.

You're forgetting that we're in a CB newsgroup where the typical radio
(or amp) output is 50 ohms. Thus, in this typical CB situation, knowing
the SWR equals knowing the match. Furthermore, there are additional
losses associated with higher SWRs (even with a perfect match). So, in
this case, knowing the SWR is actually more useful than merely knowing
you have a good match.

[snip]

> If the extra 1/4 wl of coax acting as a transformer actually improves the

> cable would be a better choice. OF course none of this changes SWR but it
> does change the load the radio sees which is really what SWR meters measure.
> Better match will appear as a broader match.

I more or less agree with everything you've said but the discussion was
about SWR versus line length. Furthermore, you have fallen into a bad
habit that hams tend to do on this CB newsgroup. You are raising
scenarios that are atypical for CBers. CBers generally do not tune
the output of their radios (or amps) to match the input impedance of
their coax. Many of the broadbanded output circuits in these radios

and amps do not even accommodate tuning.

This drives me crazy when hams use this CB newsgroup to talk about output tuning, ladder lines, baluns, folded dipoles and other items that are generally not employed by CBers.

What I try to provide are techniques and theory that are useful to the typical CBer. And I try to stamp out myths and misinformation (usually regarding coax length) that are counterproductive to using or understanding the use of a CB. In this case, it was a claim that 3/4 wavelength of coax broadens the "SWR bandwidth" -- which it does not.

NOT! It's illegal to SELL 10/11 meter amps. It's quite legal for a ham to use one though. A ham can use anything as long as his signal is clean and legal power. He could even build it him or herself. My henry 2k is quite legal on 10m even though it wasn't sold to operate on that band without modification. MK

It is in good shape and operates perfectly. Recently had aligned and calibrated per service manual.

Comes with the optional desk mic SM-5, service maual, operating manual, & power cord. This will Transmit & Receive MARS, CAP, WARC, CB, continuous tuning from 0-30Mhz. 100 watts all bands, AM/RTTY/CW/USB/LSB You will not be disappointed. I can transmit pictures electronically if needed.

NOW, what I am looking for is a Yaesu FT 102 or will sell for $400.00

Thank you

I bought a Cobra 148 GTL CB radio and hooked it up to a 3-5 AMP Powersupply. When I turned it on all the way (volume all the way up) all I can hear is a faint static. I hooked up a mag mount antenna to it and tried to talk. I hear myself perfect on a scanner. But wasnt receiving anything. I hooked up a little Rat Shack cbradio and transmitted on the same channel as the Cobra, and the sig meter on the cobra said it was a 7-9 but wasnt picking it up. All I could hear was that faint static in the background, and could hear myself, but just barely, as if i was 10,000 miles away mixed in the static. Can someone please suggest something to do other than send it back. Has anyone encountered this problem. Please let me know!! Thanks

>hear myself perfect on a scanner. But wasnt receiving anything. I hooked
>up a little Rat Shack cbradio and transmitted on the same channel as........""

Well, here's some Basic Suggestions,
1) You can damage the radio using a mobile "mag mount" antenna indoors. The SWR may be too high. Remember, even a "broken coathanger" jammed into the antenna jack will allow you to be heard on a nearby scanner, but you can't receive or Xmit any distance with it.
2) My impression is that you are very new to all this, so check the following. The RF gain control on the 148 needs to be all the way up in order to get signal strength compareable to the cheap radioshack rig (that doesn't have an RF gain control, & therefore is set "all the way up" internally). There may also be an open or short in the mag antenna or cable, if you can hook up the 148 temporarily into the lighter socket of someones car & hook to another mobile antenna that has no problems, you will see right away what going on. If the radio still receives nil, it may be a problem in the radio, but if the 148 is fine in the car, then it is your antenna/hookups.....
As a Radio dealer, I know that If you bought your CB from a local dealer, he/she should be able to test & get to the bottom of it very quickly, if you got it mail order, then as you know it's going to be box, packing, postage, phone calls, weeks etc.......Good Luck

I am 27 years of age, I do own a cell phone and
don't even own a RF amp because I don't need
one. There isn't anywhere in world I cannot
communicate with on 100 watts or less and simple
wire antennas. It is the narrow-minded people
who think they need 2KW amps and large beams
to communicate with another station! Even when the
sunspot cycle was at it's worse, using CW I could still
communicate with Japan using 100 watts or less and
a simple wire antenna. 9 out of 10 people using a
RF amp don't know even how to use it properly.
You can tell this by just listening to the poor quality of
their signal and how they splatter all over the band!
More is not better!

David from VA.

Hey Brooks, since you've opted to call people names on the net again, I'll have to inform this newsgroup of a fellow resident of the City of Troy, New York. The last time you called someone a "dick smoker," somebody followed up with the posting where you admitted you are HIV positive and take many of the prescribed drugs for that disease - so I think it's a little more likely that you have engaged in that type of conduct. ;-)

Gary Brooks, who has at least one felony conviction and at least one DUI in his past according to the Troy Police Department, is most-widely known on the internet as a dealer in counterfeit Microsoft software out of his subsidized housing project a few blocks away from me on 114th Street here in Troy. Brooks used to deal in copies of Microsoft Office Pro 97 for as low as $52.00 and copies of NT Workstation for about $60.00.

He's had a number of email such as flash@wizvax.net and has disguised himself as a female customer of himself to "verify" the authenticity of his counterfeit product.

After heckling some poor bastard down in Virginia with a bunch of some true, some false allegations, the guy went to work on Brooks and from what I can recall, eventually ended up getting this guy arrested and charged with two felonies - criminal possession of computer software and possession of counterfeit computer software. The guy is Virginia ended up suing this idiot, and from what I recall, Brooks defaulted on the lawsuit to the tune of $150,000. Several months after defaulting, Brooks asked the court to set aside the default judgment because he "was sick" and the guy and the court AGREED on condition that Brooks make any further argument about the case in person.

The guy apparently agreed to settle with Brooks, accepting the approximately $3000 the Renesslaer County Sheriff seized out of Brooks' account under Court order.

Judging by other postings in DEJA NEWS, my fellow Troy resident is again dealing in Microsoft product of questionable authenticity.

What ever happened to your two felony charges, Brooks?

FWIW, Brooks is not only a convicted felon, he's also a RAT having "ratted" out people above him in order to try and get a lesser sentence, to include at least one company in Arizona.

He's also got an outstanding criminal warrant down in Virginia, now we see he's settled into illegal modifications to communications equipment.

What a jerk.

OK. Try that on UHF and see how far you get. Amplifiers have their place.
You have to be smart enough to know when and when you don't need one.

Try turning up the RF gain,THEN, check your microphone connector on the radio AND the cord. If there are problems with the mic, some of those radios will not receive at all.
Then, check the leads to the speaker, and also any loose/shorted wires inside the chassis.
Hearing yourself perfect "on a scanner" is a bit vague... you mean you can hear yourself on a VHF/UHF scanner? You shouldn't! Perhaps you mean a scanner that covers 27 MHz as well as VHF/UHF?

Hi there,
Having just purchased a pair of PMR446 handhelds from the local Dixons I was
wondering
if anyone else using these radios have found out if battery packs and/or
drop-in chargers can
be purchased for them.
Local sales droids at Dixons and Link say only cases and spkr/mics are
available but as there
appear to be charger pins on the rear of the battery cover it would seem
logical that batteries
and charger should be available or why bother putting the pins there????

Any help out there?????

P.S. If you're going to Elvaston Radio Rally this weekend listen out on Ch2
(no CTCSS) and
I'll be there chatting to my friend Paul.

It wouldn't surprise me if both some of the ham nuts and CB nuts place some posts in their own forum to garner more hatred of the others. Oh well - both amateurs and cbers are (I assume), radio enthusiasts. From my dealings in the past with both groups, the CBers tend to be friendlier (or maybe most of them have a life beyond the radio). In any case, I'll bet the big power users (I'm not talking a 250 watt linear, I'm talking 2000, 3000, and more watts) of both groups tend to be the nastier. Maybe not, but my guess is all that high-power RF has affected the grey matter. Or, perhaps it is 'I can afford all this, therefor I own the airwaves'. I dunno.

Sigh ...

Jim, AA2QA
ps - I run 1.5 to 5 watts on 440 MHz - that's all. It's good enough to get me a consistant 60 mile plus communications range and I have never wanted to work DX.

Or alternately, you could buy a brand spanking new one from
Copper, for a mere $49.99 plus shipping.

I assume you mean the ones with driver stages that
are kilowatt PEP class boxes under normal drive
and voltage conditions.

I've sold a couple of XT-400s and they're okay.
The builder is open minded and intent on con-
tinuously improving the product, so the latest
ones should be as good or better than ever.

I agree. Comp boxes are expensive for what you
really get. They should at least look decent.

The average wattage of the carrier portion of a modulated signal never
changes. The amplitude for the carrier at any given instant along the
crest does. So you are technically correct in saying the carrier does
change size, but not average power.

> Off the subject, but exactly how does the speech processor work? I am
> curious of the details.

It works really good! Sorry couldn't resist. No real secret technology.
It is commercial quality because of speed. Consumer grade compression
is rarely higher than 7 to 1 compression ratio. Input changes 7 db
output changes 1 db. Commercial grade compression is 15 to 1 and higher.
Input changes 15 db output changes 1 db. To change gain radically like
that and not sound funny takes a fast circuit. 15 to 1 compression with
extremely low noise and very low distortion for the price RFL is asking
is a good deal. If you were to adapt a pro audio or commercial broadcast
speech processor to do the same job for you could spend hundreds to
thousands of dollars. The clipper processors out there on the market are
loud and inexspensive but the reallity is they don't sound that good. If
you want to be loud and still sound good the RFL Labs processor will do
a good job. Some people claim that compression is not as effective
as clipping. That is not true. Fast compression is as effective as
clipping but does not sound funny or fuzzy. Thanks for asking.

Hello joe. I am currently using an I Max 2000 on my base station (house), I have upgraded from an A99.... The I Max is FAR superior to the Antron...I am not sure how it will work on a boat, but I can tell you this.I can't talk out there on the air for more than 15 minutes, without someone from DX land asking for a long distance radio check,....(It gets pretty aggravating somtimes!!!) Keep in mind though, that the I Max is 24 feet long, and weighs about 6--- 6 1/2 lbs., and has some windload to it ......Maybe you might consider the Shakespeare ABS1600 5/8 wave, it is only 21' long, and a little lighter........Keep in touch, and let me know how it goes.......

5365. Re: Grant LT or Grant XL What is the Difference?

Newsgroup: rec.radio.cb
Date: 2000-06-10 00:00:00 UTC
From: BLY <bly213@nospam.att.net>
Message-ID: <Cgh05.3350$yA5.200874@bgtnsc05-news.ops.worldnet.att.net>
Source record: 39038

Well, since nobody ever responded to my question and I have now received
and used the Grant LT first hand, I can answer my own question without any
of the BS hype being thrown around. The fact is the Uniden Grant LT is as
good as or better than the older Grant XL in performance. Ergonomically,
it has the green back lighted controls and a front mounted mic connector and
a bar type tuning knob. For use in a mobile, these are all advantages over the
older XL. However used at home as a base station I find those back lighted
controls abit too bright in a dark room.

Audio, power and tweak wise, the Grant LT is equivalent to the Grant XL.
The receiver section is still top notch (one of the best on the market for
standard CB rigs) using dual conversion IF's for more selectivity. The NB/ANL
feature really works nice cleaning out any static or impulse noises without
adversely
affecting the receiver's quality. Most times the ANL cleans up a noisey
background
so clear that the "weak audio" stations come in clear without any noise! No
Shit!
One of the best receive section if not the best you can get today.

The "Dynamic Squelch Control" feature is useless when the band is very very
noisey.
It never squelchs under those conditions. But when it is fairly quiet with a
mild
background noises, the DSL will automatically set the squelch threshold pretty
good and
squelch out the noise. When a signal strong enough to be heard clearly enough
is received,
then the squelch opens. But I don't use the DSL feature because I leave my
squelch open
when I am trying to copy them weak DX stations in the noise.

This is the honest truth on the Grant LT. It is as good as or better than the
Grant XL.

BTW, my Astatic D104M6 mike works great with the rig and I have opened the audio
modulation limiter on it. You really don't need a power mic, but the D104M6 does
have
a crisper louder and higher quality sound to it than the "Bearcat" Uniden stock
mic.

Bill.

From: kombanwa@my-deja.com
Message-ID: <8hsacpjm1@nnrp1.deja.com>
Source record: 39041

On the ICW just north of Charleston, some conduit or pipe hanging from a bridge snatched my VHF antenna. I need to replace it, so I would like to determine which antenna, 63 feet high, will give me the best performance. (I am not going to stick an 8 foot antenna up there).

As I recall, Practical Sailor did some testing of antennas not long ago, I remember that their were large difference between antennas, but beyond that don't know what their findings were. I have looked at some of the archives and see that a Shakespeare Galaxy is well regarded. Any guidance?

Source record: 39148

Hey I just read your come back and I can tell you that I live in the great big noisey
busy, hustlin' bustlin town of NYC, NY! And I tell you that the CB scene is DEAD
as hell compared to when I was really active in it back in 1972 through the early 1980's.
Back then every Radio Shack and Lafayette store carried tons and tons of CB parts,
accessories and radios. And back them there were quite a few Mom and Pop small outfits
flourishing around this grand ol' town selling all kinds of DB and radio parts and things.

Today, they are all gone.

nuff' said.

So CB is making a come back? May be true to some extent but compared to what, a dead
CB scene?

BTW, I've bought stuff from Bill's 2-Way and they indeed are an excellent dealer/seller
that I too will recommend to folks seeking CB or 2way radio stuff. Just that I'd hate
to order a 100 foot length of CB cable from CA when I can go get it locally first. That stuff
will be heavy to ship and bring up the cost I would assume.

Anyhow now you know where my general 20 is and you can see that it "ain't a deadhorse town"! But
CB is relatively dead except for mostly non-English speaking station activity these days. In the
old days (before and through the Trucker CB craze) there were locals all over the place and everyone knew each
other. There were decent QSO's all day and night long on almost every channel. Not so today. Today every so often
you get a decent serious chit chat without the stupid BS crap-ola. Today it seems to be mostly
taken over by teenagers and kids (as well as the lost wanna-be technician adults) running linears and
on a power trip trying to see who can talk over who and fighting and calling each other names all day long.
I guess it is okay to goof around for alittle while, but these new wave CB'ers go at it constantly all the time
everytime they are on. IT gets old quick. What a lost bunch of youth. Very

rare to get in on a decent intelligent
conversation on the CB band. Ahhh and then there are the fancy talking,
hip-hop, bee-bop DX skip seekers.
That's what the CB scene is like around here today.

Wow! Sorry for your luck! I don't know about hip-hop, bee-bop, but there certainly are many of us DX chasers here in the 'pile. There are many fine conversations taking place just like the "old" days. (I was there too) We have nets running around the clock. We also get our share of espanol, but we also get great skip conditions. All the channels here are active. Its actually hard to find a clear channel during the day, DX or not. As a matter of fact, New York has been quite active here for the last few days. SSB offers a good respite from the AM trash, we get our share of that as well. I do not know if sales figures are approaching the 70s, but I do know that sales have been increasing steadily each year. It is true that your average operator is running more power than back then, but The-times-they-are-a-changin'. Now sit back and enjoy the radio police who are drooling over the keyboard waitng to attack me for that last line which inevitably will be taken as my condonement.

They are almost certainly illegal to be sold, but that's another
problem.
Legal, as long as the amp is reasonably clean.
We are expected to maintain some spectral purity. Specs are in the
handbook.
There are a few rules that come into play if you sell them,
but you can use anything you have, and can buy anything you can
afford.

If you classify mobile mounting places as 'roof', 'sides', and
'bumper', the bumper mount is the least efficient. If the antenna
parallels the body of the vehicle (metal) for any appreciable part
of the antenna's length, a significant portion of the radiated signal
is 'nulified'. This shows up as a possible reduction of signal
strength on the 'side' the body of the vehicle is from the antenna.

What is there to dispute? If the match between radio and load is improved the Minimum SWR "reading" will be closer to 1:1. What else can this do except broaden the SWR"reading"/banwidth ratio. As the whole "U" shaped curve drops down this means the x axis will have to be extended until they meet the same SWR points on the Y axis. Remember I am not saying that the actual SWR bandwidth is being broadened. Actually it is the impedance match vs freq ratio that is being made wider. There is justifiable reason for running a particular length of coax especially if you are using a tube amp that does not tune well below 50 ohms and for an untunable solid state amp that does not have a 50 impedance.

5397. Re: Grounding a van

Newsgroup: rec.radio.cb

HBrown1003,
The idea is to have all body panels, motor, exhaust system, etc, grounded to the same point, in most cases, the frame. One suggestion, don't use braid, instead use copper strap, such as the type used for 'flashing' around chimneys, roof edges, and so on. Braid from coax cable will deteriorate rapidly if exposed to weather/polution/crud. As the braid is gradually eaten away, the part it is grounding gradually looses ground.

Professor,
The 'power' of the carrier of an AM signal does not change. It is constant. After the addition of any 'modulating' signal to the carrier, the resultant wave form then will a power level less than the carrier at times. But, the carrier power has not changed. Because of vector addition, the resultant signal does change. Any change in the carrier power level will appear on the resultant signal as distortion, and in some cases it is audible.

IMHO - No one would notice the difference between the 2970hp and a 350
watt amp. The PEP power on the 2970, even on low, would be too much
for a 2 pill amp and would beat the pills down over time.

The Cobras mostly have a 5 pin mike...
the 5th for receive. Try to get a hold
of a mike you know that works and see if
you get receive.

If not it is back to the shop for
warranty.
Cheers,
John

right, the relay doesn't have to have the switch to work. it
only needs it to keep from working too much....the only way you
could keep it from chattering on SSB would be to overmodulate or
do the old Ahhhh routeen. been there, done that...

>Driven by an HTX-100 or other "Type approved" 10m transceiver.
>
>Gary K7MHZ

No amateur transceivers are Type Accepted, they aren't required to
be (though *receivers* operating above 30 MHz must be Type Certified,
a different thing). But external linear power amplifiers for use on HF
have to be Type Accepted in order to be legally manufactured, imported,
or sold in the US.

So a Palomar, Texas Star, etc is thus contraband because none of
them are Type Accepted amplifiers (and can't qualify to be Type
Accepted because they exhibit power gain with less than 65 watts
input drive). The FCC considers possession of such contraband
prima facie evidence of illegal activity. They will confiscate it and
destroy it if they happen to find you in possession of it.

Now an amateur can *build* an external power amplifier (no more
than one of a given design per year), and that amp doesn't have to
be Type Accepted, though it does have to meet spectral purity limits.
So you could consider the Palomar a box of parts from which you
build an amp, and sneak in under this subsection of the rules
(provided you actually do some modification or assembly, which
you'll have to do to make it meet spectral purity limits). You
should be ready to prove that, though, if you have an encounter
with the FCC. Having an amateur license doesn't automatically
give you a blank check to possess or use contraband equipment.

I have a Wilson 1000 magnet mount (black) on
my Jeep GC and works very good. I have seen
other SUV's on the road with the Wilson and you can't
see the antenna until you get up close unless your looking
for it. The stinger is long but thats why it gets out so good.

> mediocre tube can test good ,but it won't put out,......cd is out....

dan
Obviously you must have been burned on some tubes you purchased dirt cheap
on ebay or from a swap meet
I'm not online to rip off people.Yes I use a tubetesters and a good ones at
that.
I use hickok 539c,118b,tv7 & sencore mutual conductance tube testers.All the
testers where calibrated professionally
If you have any knowledge about tubes you that they are the best testers out
there.
Occasionly a tester can be wrong .Over the years I have found the best way
to test a tube is to put it in to a circuit but
in most situations it is not feasible.

You say tubes won't put out ?? Even a weak tube will put out to a point if a
radio or amp is properly tuned buy a qualified tech It sometimes is not as

simple as replacing a tube

Track record on sales??
check ebay under my call sign n9tew
I dont sell tubes under a allies name

Why do you say tubes are in short supply???
In 5-10 years maybe
I saw plenty of tubes at the dayton hamvention

Well all I can suggest is a simple answer. It could be the
speaker wire has come loose, if so, all it will need is to be
soldered back on.. Seeing as they are so old that could be the
prob...

If you transmit OK, and then on receive have a 7-9 indication without
sound, then:

Turn the squelch off.

exellent in dx's of course, any radio can dx , they just don't have
alot of bells and whisles that 'the big' radios has but will work just
as good
As for a 2950 glad you got it cheap because they sure are junk , high
repair radio good point on them lot of channels get alot of power
output , but as with any 'radio you're only as good as you're antenna

\
Bill , sorry didn't respond to you'r post but just got on here .
I personaly think you will enjoy you'r new grant , they are better
than the old , and i'm not knocking the old off either they;'r exellent
radios as well
but I do like the back lighting cleaner look to the radios appearance
don't like the mike audio if peaked out right will be very very
clean!
the recieve will be exellent the dynamic squelch control does not
interfer with the operation of the radios performance in ANYWAY!
other than that the radio is same board thats been used for long time
(ie cobra 2000) I don't know how you have you'r radio set (peak/tune)
but if you put a swing kit in it (not one you buy) you should see 18-
25 wats easly obtained in that radio

Ok , you want to run a 2970 into a texas star 350 hdv, ? right ???
yes you can ! wacth you dead key keep it low around 3- 5 wats ,, I
KNOW IT'S A HIGH DRIVE!!! but you will get more out of it (all boxxes
for that matter) putn yo a swing kit in (not the one you buy!!!!)
you'r 2970 is very capable of swinging up to 250 wats itself
but you can drive that modulation thru the 350 hdv
IF YOU KEEP YOU"RB DEAD KEY TO AROUND 3-5 WATS!!!!!!
AND YOU HAVE THE RIGHT SWING KIT IN YOU'R RADIO !!!!!
As for what you should see in the way of out put ?? 600-800 wats swing
on you'r 350 hdv , with a dead key of around 100 wats or so
GOOD LUCK !! MOPAR

hello,
I am currently hooked up to microwave internet, the technician
installed an antenna on my roof. Later we discovered that the antenna
wasn't raised high enough to reach over some trees and a small hill, I
think it needs to raise to around 10 metres above my roof in order to
reach over the hill, trees etc., currently it's around 5 metres above
the roof. How much would a 10m roof-top pole, tower or whatever cost?

thank you

> and amplification level.....

In order to use any commercial 160m-15m HF amp on 10m, you have to "homebrew" the 10m section to enable it to operate. If you had to buy parts for this, I imagine the company would want to see proof of a ticket. There are NO amps legally sold for use from 24 to 35 mhz. Period. There are NO amps sold for use below 144 mhz that are not "certified" in the fcc database. Except for 1 a year that a ham can make and sell if he wants. A non ham can not build and sell an amp that operate below 144 mhz without certification. Period. There is no "type acceptance" for external power amps anymore. I can read part 97 quite well. Should I go on? MK

I've got a Midland 79-290 that works fine, but the display is totally shot. I contacted Midland, and for a replacement faceplate they want $150. The whole radio new doesn't cost much more than that. So, if anyone's got a 79-290 that's gotten a little too much of the "golden screwdriver" that has a decent faceplate, please let me know. Email me at gadget@jnlk.com Thanks!!

Disable the talkback. I know how it's done on a Galaxy 88 or 99, but no idea if a Northstar is the same. Any decent radio shop, or probably someone here could tell you how to put a switch on it to shut it off. Talkback can get irritating after awhile anyway ;)

5441. Clarifier Question

Newsgroup: rec.radio.cb
Date: 2000-06-12 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <en615.9320$qS3.24198@tor-nn1.netcom.ca>
Source record: 39214

Hello there,

Could somebody tell me exactly what a clarifier does ? (I have a Uniden PC122XL). Does it only adjust the receiving frequency, or does it also adjust the transmit frequency ?

The reason I ask, this that quite often when I clarify somebody in on SSB, they will respond with telling me that I am off frequency. The only way to get round this is to leave the clarifier at 12 o'clock (centered) and then listen to them sounding like a martian. Then they hear me fine.

Could my TX and RX not be aligned ?

Apart from that, the radio works fine. I spoke to Wisconsin and Indiana from mid Northen Ontario Canada while mobile. Not a great distance, but for an unmodified radio with a K-40 on the trunk I am quite pleased.

Thanks,

Richard.

5446. Base Antenna Help

Newsgroup: rec.radio.cb
Date: 2000-06-12 00:00:00 UTC
From: WW_725@webtv.net
Message-ID: <1357-3944F0C8-12@storefull-293.iap.bryant.webtv.net>
Source record: 39219

I have a tower that is 57' from ground to top plate..I am looking to put up a good antenna system that will work as well for local as well as skip..It was suggested to me that a 3 element beam, mounted horizontally with a stick antenna on top with both going through a switch box would be a dynamite set-up..I have close neighbors and TVI is a consideration too...I really need some advice on this matter and all help would be appreciated..I have a 2950 Ranger on a power supply and plan to run about 500 watts or so..Thank you in advance..

That seemed to help a bit but it still somtimes squeels. is there anything
else I can try.
Also this radio looks exactly like the colt excalibur, is it the same?
and is it any good?

> advantages at all as far as I'm concerned.

i agree as long as they work out the bugs that make the radio do something totally different then you intended when pushing a button and tighten up the recieve. for instance all the 2950's ive had or used would do some really bizzare shit when trying to turn on or off the beep or using the shift button or any other for that matter, thats a real pain when driving on a busy road.

>I've performed "A-B" receiver tests

i have too and my test were for long time use and the higher price radios were always better and easier on the operator by a good margine

>In other words, when all
> other things are equal, I honestly believe that you won't
> hear signals on one that you won't hear on another. The

> hear anything on the 2510 that you won't hear on the 2950.

i agree, if a person does any type of extended radio operations the 2950's and midlands shrill sounding reciever that lacks rejection is really a pain and can cause a headache fast. you might not here any more with the 2510 but what you do hear will be better sounding

A young couple were married and celebrated their first night together, doing what newlyweds do, time and time again, all night long. Morning comes and the groom goes into the bathroom but finds no towel when he emerges from the shower. He asks the bride to please bring one from the bedroom. When she gets to the bathroom door, he opened the door, exposing his body for the first time to his bride. Her eyes went up and down and at about midway, they stopped and stared and she asked shyly, "What's that?" pointing to a small part of his anatomy. He, also being shy, thought for a minute and then said, "Well, that's what we had so much fun with last night." And she, in amazement, asked, "Is that all we have left?"

WW_725,
Your idea sound okay, good height, choice of antennas
sounds at the very least adequate. You might think about
mounting the beam vertically, but should work either way.
Another good idea would be to put in a good RF ground
system. Lay out radials around the tower, terminate them
with ground rods. Not only make a good RF ground but a
good electrical ground too. Might come in handy if your
worried about RFI complaints...

Richard,
Sounds like your clarifier has been modified to 'gang'
both transmit and receive. It's moving both your transmit
and receive frequencies at the same time. Some times good,
some times not, depending on how the other station's set
up. Theres no real way of telling if your transmit and
receive frequencies are 'zeroed' with out some test equip-
ment, and then you get to convince the 'other' station
that he's off frequency! 'Catch-22'
Good luck...
'Doc

azimuth,
Sounds like he got what he deserved. If you want a case
to 'stand up' in court you have to follow procedures as to
evidence. That takes time. You alos need to catch them in
the act, or while transmitting, and that takes time. Just
one year isn't bad at all.

John Doe,
Unstable usually refers to frequency, and with an amplifier
that usually means that they tend to oscilate. That won't
'take out' buildings for six blocks, but it usually does 'take
out' the final transistor/tube. May not be much education, but
it's free...

I use my 2950 almost exclusively for SSB and I don't have any problem with any "shrill sounding" receiver.. it sounds great...

>i agree as long as they work out the bugs that make the radio do something
>totally different then you intended when pushing a button
>for instance all the 2950's ive had or used would do some really

Sounds like you had a bad internal battery. A very simple fix. That happens if you keep the radio turned off a lot (Such as in a mobile setup). Since I use mine as a base, I need it turned on all the time and just turn down the volume, to conserve the internal battery.

would not exactly say kicks its a$$, But the Saturn will blow the 2510 out
of the water on AM transmit......

Depends what you want, and where your going to use it....

5477. Re: anyone know anything about a Tram Titan?

Newsgroup: rec.radio.cb
Date: 2000-06-12 00:00:00 UTC
From: killrwat <killrwat@dwave.net>
Message-ID: <39454a82$0$36225$4bb17d6e@news.dwave.net>
Source record: 39250

It can be done, but not as easily as the D201's, it essentially requires
building a new VFO... much easier to just get an outboard VFO, plus then
you retain the vintage fellow in original condition, unmodified is MUCH
more desireable then a hack job..... an outboard vfo is simple to connect,
solder a couple wires to the crystal socket and remove the crystal.....
done correcty it wil NOT detract from the value...

The Adjacent Channel rejection is completely acceptable, the radio even comes very close to the factory stated spes. I own and use two of these on both 11 and 10 meters, its one of my favorite radios, I would rather use one of these than any of the other so-called 10 meter radios! Sold 25 of these so far to the locals, not a single complaint i can go a 20 or 30 KC's away from the Bowl when its really rolling and cannot hear it.....

>Could my TX and RX not be aligned ?

The procedure for aligning a clarifiers TX and RX can be accomplished with the use of a dial tone and a cooperating properly aligned operator.

Just transmit your dial tone to the operator and have him zero beat it to his own dial tone. Do not let the operator or yourself move the clarifier from this point on. You are now transmitting in line with the operator.

Next pick up your phone and have the operator transmit his own dial tone. Make your own internal receiver adjustment while zero beating the two dial tones. If this procedure is followed you can easily be aligned within a few hertz.

Done.

The exact frequency of alignment, just as the exact frequency of transmitting is unimportant. What is important is to have all the TX's and all the RX's on the same page. Once done you can all quickly move to whatever page you want without fear of getting lost.

what kind of mike??? i've had certain radios that just would not work with
a particular mike, just because the mike works on others does not maen it
will work on this one, if its a pre-amped mike this goes double! try it with
a stock handmike

LOL, A real Ham? You certainly represent The Holier than Thou Stuffed shirt Attitude!! A real Ham would NOT make the statement you just did!! Most of the Local hams around me all started in CB and some still retain there complete stations with Amplifiers et all..... CB is a stepping stone for some on the way to becoming Amateurs! That is unless they run into a Ham who thinks he is better, calls him a CHICKENBANDER and generally cuts down on his hobby!

GET A LIFE! use your knowledge to better Amateur radio. not to see how many CBers you can KNOCK!

Can any one help me?
This radio looks exactly the same as the colt excalibur is it?
Is the radio any good and what's it worth? (it's a bit rough looking)
And finaly where can I find technical info on it (schematics e.c.t)

Thank very much!!
Dan

P.S don't worry about the Jacqueline that's my mum she subscribed for me
Is there any way I can get rid of it?

Again The EARLY 2950's Had a much higher incidence of failure! Fortunately those EARLY battery backed up units have been out of production for quite some time!! I won't even mess with the early ones..... Junk in my opinion! some of them work, some don't!

5489. Uniden President Washington vs Grant LT

Newsgroup: rec.radio.cb
Date: 2000-06-12 00:00:00 UTC
From: BLY <bly213@nospam.att.net>
Message-ID: <aQc15.6893$ov1.481598@bgtnsc04-news.ops.worldnet.att.net>
Source record: 39262

Hello,does anyone know if the Uniden President Washington base station CB is the same as that used in the Uniden Grant LT or XL mobile CBs? I am reading and seeing stuff that is pointing to them not being the same chassis or design.

Also read somewhere that the Washington rig is a Single Conversion receiver as opposed to the Grant XL which is a Double Conversion receiver. In the old days they always said that the mobile receivers were built better because they had to deal
with the harsh environment of a car installation (ignition and pulse noise, and station
overload due to driving by other transmitters).

This sort of supports what I am seeing in schematic block diagrams comparing the Washington base station with the Grant LT and XL mobile rigs. Seems like it would
be better to use the mobile rig as a base station then too.

Anyone familiar with this territory? Are these boards the same or not?

Also what is the difference when I see President Washington (old) as opposed to President Washington (new)? Where there revisions or two different models or designs?

Bill.

I've been polite about the 2510 so far, the only 2950's that had the problems you refer to, were early battery backed up units, yes they were erratic and unstalble, those have been out of production for a couple years! The 2510 has a SLIGHT EDGE OVER the 2950 on TX, i repeat SLIGHT! the average person would not notice a difference, The 2510, 2600, needs some major mods and a pretty good chunk of money stuck into it to match a 2950 for features and functionality! The 2510 won't come close to a 2950 on AM! Some minor mods to the receieve/transmit on the 2950 and it WILL work better than a 2510! Erratic behavior has been eliminated in the later 2950's, 2510's Are much more likely to develope a serious problem than a 2950! An owner of a 2510 has a 25 percent chance he WILL have a major problem within 1 year of purchase, the 2950 is about 2 percent! This would NOT take into account units with operator caused problems! Again These are facts based on my experience with the radios, not an opinion or conjecture!

It basically Boils down to i like Chevys and you prefer Fords, They are both ok radios... However neither one stands as a clear WINNER. This is a Fact. Another fact is the 2950 has outsold the uniden by a pretty good margin.....

Barry,
Really doesn't matter about polarity for SSB. Since
most mobiles are vertically polarized, a horizontal
antenna sorta leaves the mobiles out. And since most
other 'bases' are vertically polarizedalso(at a guess),
you may be missing a few of them too. This isn't to say
that you couldn't talk to them anyway, just means that
they will be considerably weaker because of cross-polarization.

****

Radials under the tower will not help much for RF ground with a 3 element yagi on top of the tower. A good ground rod into the water table at the base will help for lightning protection. That will be the main concern. As for TVI he best run a very good linear or none at all. I still believe the radio alone will be a TVI source to overcome before the amp.

James,
You might be suprized about the radials under the tower, especially
if he combines that ground with one at the radio. Even if it doesn't,
it will improve performance of the antennas.
I agree about worrying about a 'clean' radio before worrying about
an amplifier. 'Course, you'll never convince some people about that.

Sorry James and Smokey... this internet page refutes your claim that the carrier amplitude stays constant!

Amplitude Modulation (AM) Amplitude Modulation occurs when a voice signal's varying voltage is applied to a carrier frequency. The carrier frequency's amplitude changes in accordance with the modulated voice signal, while the carrier's frequency does not change. http://telecom.tbi.net/mod1.html
What do you have to say about this?

"number 22 N.C. IL.",
Over driving is probably the most common cause for
'splatter', either over driving the audio, or if used, over
driving the amplifier, or both. Also could be inadequate
filtering on the transmitter or amplifier.

Folks, after studying up on the Grant XL, I see that it is NOT a Dual Conversion receiver
but is in fact a Single Conversion receiver same as the Uniden Washington Base station.
They both have TWO crystal filters in their IF sections however and that is what helps
to make them better and more selective receivers than single filter receivers.

This might be OK except, isn't it illegal to sell a 23 channel CB since they don't meet the current type acceptance critierior? Seems to me I remember the FCC ordering this when they opted for 40 channels.

Looks like you may be the collector on this one.....

Add a spring to the mount, Will help lessen damage to the antenna, although
it will cause the antenna to whip around more, If that is a problem then go
with the stiffest spring you can get.

This argument can go on forever until there's an agreement on which
domain to use. In other words, in the frequency domain (spectrum
analyzer) the carrier power is constant. In the time domain (scopes
and meters) the carrier power varies.

Look at Motorola history. Helge Granberg with help from
other Motorola RF engineers are the literal creators of
the technology known as "stripline." That's what all of
today's DC CB comp and daily-use amps are based on.

RF Parts sells a book called "Motorola RF Application
Reports." It's not expensive and it proves my point.
Broadband transformers, splitters and combiners, strip-
line board technology, and emitter ballasted transistors
(pills) are all explained there--and have been explained
there since the early 70's--which is when it all started.

I agree, but there are alot of mods around that tighten
up many of those problems. You have to keep in mind
that the 2950 has been around since '88. To my knowledge
the DX model represents the 4th generation. Many of the
early problems are (or should be) solved. I've tested
some 3rd generation units. Many of the little annoying
problems of earlier units are gone. I'm hoping the 4th
generation proves to be the best yet. Sooner or later,
the 2950 will become the next generation 148.

TR24 does both AM and SSB. I think that's a better
way to go than R131 (which only does AM). You have
to keep in mind that you still have the Dynamike
control on the front panel.

I used to sell Boomers a few years ago. They said
Class AB1 on the front, but were Class C (unbiased)
in reality. That may have changed but I doubt it.

First of all, I can't see any solid-state amp that
uses bipolar transistors being AB1 since AB1 means
no base (grid) current is drawn. AB2 is more like
it.

Secondly, in all the vertical transformer amps I've
seen, the bias circuit is there but purposely grounded
out--probably to increase stability since the original
design uses very high-gain transistors and no feedback.
(Vertical transformer amps include Palomar Elite, Boomer,
Boomer Deluxe, and others.)

Unless some radical changes have been made to the designs,
or the dealer is an amp tech and spent time improving them
(like I did when I sold them), I would steer clear of the
vertical transformer amps.

Source record: 39299

The reason is not that important, What is important is the restiction of freedom to enjoy your chosen hobby (regardless of what it is).

But since you asked
I pulled into a shopping center parking lot,approx 85 feet, tried to DX at TV station (Channel 5)on my 2 inch Casio TV .Having NO luck I exited the parking lot...Heading east.

The traffic manuver was completely legal, I was aware of the police officer's presence..(I saw him in the gas station 150feet east of my position)and another car was parked (i kid you not) on Bearcat DR. opposite me as I exited the parking lot. This vehicle shot accross the roadway into the parkinglot I had just left.

NO police cars followed me, I check my mirrors frequently
2 miles later I was pulled over (TWP border)
HE must have approached me from behind with his headlights off for 2 miles, rural road night time...
Could I have appeared suspicious , Maybe....
Article 4 of the U.S. Constitution gaurantees the right of travel.

The stop was completely by the book
signal,Pull over,interior lights on,window down, engine off , keys on the dash, Hands on the wheel in view,
NO attempt to hide the scanner (remember at this time I did not know they were illegal).

Any way the stop progressed, Frisk (bunch of Questions)
Frisked again (Locked in police car) ,Bunch of questions...about the scanner, and my wherabouts...

Like I said , I was innocent, had commited no Crimes,but suddenly I thought I was in Russia.

The police acted professionally Most of the time, I knew what they were going to do before or while they were doing it, I understand the reason for calling Backup. SAFETY FIRST.

I Was thought of as a criminal FIRST and Foremost, Never was I treated as a hobbyist... A GEEK maybee, but not a hobbyist.

I left some of the mundane out. but generally, that's how it went down.
I Cannot change the actions of the police or what caused them to pull me over. (whatever reason) I was never told, I did not ask.
I complied with all demands of the officers, and willingly allowed a search of my vehicle...
I did write the city's chamber of commerce and he suggested I was lucky

not to get the "S#!# kicked out of me.

I felt the officers cut me a break, they certainly could have arrested
me and stated they would have, if they found Local Police freqs in the
radio....MY PRO92 was searched channel by channel...

Lucky I guess, I just don't want this to happen to you...
We Must change the mindset of the police and NOT associate Scannists
with criminals just because we may use the same equipment..

Thanks,

Mark Bajek

I do now have a scanner permit from MSP..however it will only keep me
out of jail , I MUST still profess my innocence and prove by
documentation of my worthyness to have a scanner.

NO ONE should have to be permitted to "listen to anything" just
transmit.
Tourists can't even do that.
WE ARE NOT CRIMINALS AND SHOULD NOT BE TREATED AS SUCH,
I cannot condone the current state of affairs,please join the challenge
to alter this law...Write lansing.

>
> Hi Bill. I ofteb read and occasionally post on rec.radio.cb and have found your advice to
be very good.

Well thank you.

> I thought of posing this quewstion on the newsgroup, howeve it is somewhat off-topic to cb
radio. I have a couple of 10/11 meter amplifiers that I am curious about modifying for 20
meter use. I have a Messenger 300 and a Palomar Skipper 350 solid state moblile.

Let's make sure I've got this right. I'm assuming both amps are solid-state mobiles. If I'm wrong, let me know. I'm familiar with both of the names, but there used to be an amp called the Palomar Skipper 300 that was a tube-type base amp. I'm about 95% sure you're talking about the solid-state mobile Skipper, but I just want to be sure.

> Would it be practical to modify either of these amps for use with a 20 meter qrp rig?

Both can be modified, however one might be harder than the other.

> Any advice you could provide would be greatly appreciated.

The basic design of both amps will cover 3-30 MHz. However, one or both of them have coils and capacitors in the output signal path that form a Chebyshev style filter as well as tuning the output to resonance over the 10/11 meter band. To function in the 20 meter band, that filter will have to be bypassed or modified, the output re-resonated, and, more than likely, the negative feedback loops modified in order to increase the level of feedback to compensate for the increased gain on the lower band.

If you're still with me, I'll get into more detail:

I sell the Blue Face (Palomar, Galaxy, Magnum, Palomar Skipper) 350s. I know for a fact that they have the output filtering/tuning circuit in them. The manufacturer states that the useful stock frequency range of those amps is limited to 25-30 MHz. On the other hand, I don't carry Messenger, so I'm not sure if your unit has a filtered output circuit. I've repaired plenty of Messengers, so I'm familiar with them. Some have filtered outputs and some don't. What I'm getting at here is that the amps that don't have filtered output circuits will work from 3-30 MHz with little or

no modification. Your Messenger may be one of those, so you should investigate it first. To do so, you need to understand how solid-state amps work well enough to trace the signal path from the secondary of the output transformer to the TX relay. (Of course if you have a digital camera or a scanner, you could send me pictures of the inside of the amp and I could let you know based on what I see.) If all you find is one capacitor, you're looking at a broad-band (3-30 MHz) amp. If, on the other hand, you find one or more coils and two or more capacitors, you're looking at an amp with a filtered output that will have to be modified.

The mods in their easiest form are fairly straight forward. The idea is to simply bypass the output filtering in order to make the amp work over the entire 3-30 MHz range. That's just a matter of removing all but the first cap in the output filter network and providing a straight path to the TX relay. The one cap that you leave in should be re-tuned (change values or use a mica trimmer) to achieve maximum output, best stability, and best input SWR in the middle of the new operating band. When the amp is broad-banded the output load cap (the one you leave in) value won't be critical. Something on the order of 50-200 pF will probably optimize the circuit. The other mod I recommend is increasing the negative feedback in order to increase stability and decrease distortion. Both amps already have negative feedback loops. Your job will be to change the part values. The feedback loops consist of a resistor, a capacitor, and sometimes an inductor connected to each power transistor collector and base. The cap is usually a .001 or .01 disk. The resistor is usually a 100 ohm, 2 watt, flameproof carbon type. The inductor (when used) is of a very low value. To increase and broad-band the feedback loops, you'll need to bypass the inductor, increase the cap value to .1 (at 25 volts or more), and reduce the resistor value to 33 ohms. Here's the logic behind that: The inductor limits the current and frequency response--that's why it's bypassed.

The cap's job is mainly to block DC. However, it also passes some frequencies better than others, so its value should be chosen based on our goal--which is to increase feedback as the frequency of operation decreases. A .1 cap passes lower HF frequencies better than higher frequencies when compared to a .01 or .001 cap. The resistor is the most important part. The lower its value the higher the level of feedback. 100 ohms is typical but usually results in too little feedback even at CB frequencies. 33 is more like it, and you can go lower if you'd like as long as you remember that the lower you go the more current the resistor will pass and the hotter it will run. Below 33 ohms I recommend using two, 2 watt resistors in parallel on each transistor.

So, there you have it. If your Messenger doesn't have a filtered output, just do the feedback loop mod and see what happens. If it does have a filtered output, both it and the Blue Face 350 will require the same amount of work to get them to work right (stable and unattenuated) on 20 meters. The feedback loop mod is optional in that the stock level of feedback may be enough to keep the amp stable enough to work acceptably well even on 20 meters. So, all you may have to do with the Messenger is verify the presence of feedback loops and verify that the output isn't filtered. In other words, you may be able to use the Messenger on 20 meters as-is. Messenger tries to skirt the rules by making "export-only" ham amps. With that in mind, it's to their advantage to leave out the output filtering and use plenty of feedback. On the other hand, the Blue Face amps are basically specialized 10/11 meter-only amps. In my opinion, that makes them better at their job than the Messengers (that's why I sell them and not Messenger) but not as easy to modify.

They are the same with the exception that the President Washington had
two versions, Early version used an 858pll chassis, later version used the
8719pll late version was same as the Uniden....

Did I write the above? Let me attempt to make it easier to read.

Yes. You have a open clarifier. It however is not aligned. If it was aligned you, all by yourself, could zero in your own transmit simply by zeroing in on somebodies elses transmission.

Wellll, a probable cause would have given them proper reason reacting the way they did. As you are aware, in certain instances a scanner may be considered an instrument of crime. But I tend to agree that the law is ludicrous and believe the position and effort you are putting forth is admirable (especially the billboard) simply because you feel you were wronged. There are many poorly written laws on the books that need amending, nullified, or scrapped altogether. Good luck in your endeavors.

I was just wondering, how can you say that raising the antenna 4 to10 feet
will reduce TVI, if he's going to run 500wattz he will be giving TVI for
quite some distance. I know people that are running 3wattz and cause TVI.

Don't use them. It is rare to have loud audio and echoes or talkback at the same time. With talkback you want to hear it but you don't want your mike to hear it. Kind of hard to do if they are six inches apart. If you must have the talkback feature try a noise-canceling mike.

Source record: 39315

The horizontal beam under a stick antenna (A99?) is a good idea as it will act somewhat like a ground plane and help keep the RF more at the horizon. Most of the stick antennas are notorious for poor decoupling and have a lot of feedline radiation which = more potential TVI.. Getting the antenna up much higher than the neighbors TV ant will also help keep you out of their TVs. Get the best TVI filter you can find. Always ground the tower for lightning but don't expect grounding to affect or improve TVI. A nice 3 or 5 element horizontal beam will not be very useful for local talk but will work wonders over the stick antenna for skip. Mounting a CB beam vertically is usually less desirable than horizontal because the mast can affect the vertical pattern and for skip the polarity usually doesn't matter. A horizontally mounted beam will be a bit more pointy because the horizontal pattern is almost always tighter than the vertical pattern. And what do you do when your local buddies are spread all over town and you have a vertical beam? You wear out your rotor!

You will find that person somewhere along the I-90 corridor between Busse Rd. in Elk Grove and Cumberland Ave. in Chicago.

Its 20 S units up close. Well, okay, its off my scale anyway!!!!

Really? Just for conversation sake... it didnt take #123 or anyone else to start building amps "off of Dvaes design" for me to build two Dave Made clones, so far. Im not interested in mass producing, but rather help out just the closest of friend out a little by building for price. I did have to stock up a bit on the box, ferrites, pills and fans to get a good value but still. I did it and Im sure many others have by now. Didnt take me (a non-rocket scientist) to figure out how to reverse engineer Dave's boxes. I have nothing against them whatsoever (thrown in there to CMA against those who think I do), else I probably wouldnt clone his design in my or my friends boxes.

And Im not "#123"

Yes, this is a good source for a large variety of electronic parts and I also have
dealt with them for many years (about 8 - 9 years) and they have always been good. They also have "no minimum charge", so you can order one transistor or part if you like. About the only negative I've noticed about them though is that
whenever I order a large quantiy of any given part (e.g. capacitors, resistors, transistors, IC's,
lamps, etc.) at one time, they always tell me that my order will be split up and shipped
from their various warehouses (I think they have two warehouses) and they double charge you for shipping costs that way. That is if I order 10 transistors, the rep will say
they have only two in stock in their East Coast house and the rest will be from the
West Coast house. But when I finally get the parts (on separate days in two separate
shipments of course) they are all sent and post marked or stamped from the same East Coast (I think it was NJ) location. Hmmmm. ~!

MCM Electronics has also done this practice to me a few times (splitting up the shipment).

Sounds like a good setup to me. If your tower is 57' already, the mast
is going to add another 4-10'. This should put you high enough above
your neighbors to reduce the danger of causing TVI to almost nothing.
Just make sure that your tower is sturdy enough to cope with a 3 element
horizontal beam and a vertical (it should be okay).

There's nothing like working DX on the horizontal - it just plain works
better.

Source record: 39328

Thanks for the come back for all that have responded.
I have since learned that there are two versions (old) and (new).
I have also learned (I think) that the older version with the uPD858 PLL
chip used relay switching? and that there was some problem or quirk with the
relay chattering on SSB transmit? Any one know about this and whether or
not the older version is reliable or not? Are they pretty much the same
in performance and quality?
I am asking this because I just ordered a used President Washington base station
and I don't know which version it is (old) or (new). Do the two versions look
exactly alike? The one I am getting only has two pushbuttons below the channel
knob,
and one LED light above the channel knob, whereas the Uniden Washington has 3
buttons
below the channel knob and two LED lights above the channel knob. So I am
guessing that I am getting an older version of the President Washington. What
years
was this older version in production as opposed to the newer version?

Hope someone sees and can answer these questions.

Thanks!

Bill.

:>
:>The RF waveform increases. There is no carrier component
:>to this waveform.

: All SSB signals have some carrier, why doens't the carrier increase
: then?

The carrier is highly suppressed - it would not exist in a perfect SSB transmitter. I believe the requirement is at least 40 dB down for CB rigs. If so, then if you have a 10 watt PEP signal, the carrier is a maximum of 1 milliwatt.

And that carrier does not vary - even with modulation. Just like with an AM signal, it remains constant as long as the transmitter is keyed.

: and when you can't understand then you assume "I don't know". But
: I do know. You just don't understand.

I don't recall what your opinion is in this matter - as I seldom look at headers. But I can guarantee this - the carrier is constant as long as the transmitter is keyed in AM mode. This assumes a proper AM rig, and not one that has been screwdrivered to provide more "swing". It does NOT vary with modulation, even overmodulation, unless the power supply cannot provide enough current to sustain the carrier level.

I have made my living in the RF engineering field for many years. I have a lot of experience looking at signals on spectrum analyzers and monitor scopes.

Yep, TR24 basically acts like a valve (or a variable resistance) shorting the
mic audio path to ground.
TR24 is controlled by the audio modulation level fed back to it from the
transmitter stage. When the
audio modulation level goes too loud (or high) the circuitry feeding TR24 turns
TR24 "on" causing it
to conduct from collector to emitter thus lowering its resistance path and
shorting the mic signal to
ground... thus limiting it. If you totally remove TR24, then it can no longer
bypass the mic audio
signal to ground and the mic signal can fully modulate the transmitter carrier.
When TR24 is totally
removed, you can also easily "overmodulate" with a loud mic signal and splatter
your neighbors and make them
hate you for it. Some mods suggest putting a resistor in the leg of the TR24
collector path to increase
audio modulation but prevent you from totally over-modulating into distortion.

Bill.

This is false. You can verify this by listening to an AM signal with
a SSB rig. It doesn't matter if the person is talking or not - as long
as the AM transmitter is keyed, the carrier is constant in volume. It
DOES NOT vary with the modulation.

To be a bit more precise - since the carrier is a sinusoid, the power
does pass through zero watts - twice for each cycle. But this is totally
independent of the modulation sidebands - which are on different
frequencies.

Forget about your bloody misleading wattmeter. Borrow a spectrum analyzer,
or find some friendly tech in a radio shop somewhere who would be willing
to show you some signals that are on the air.

tnom@mucks.net wrote:

: There is no RF on a modulation envelope.

There certainly is, once the sidebands are created. The sidebands are pure RF.

: Get real. You only have a SINGLE RF VARYING waveform when you
: modulate. This SINGLE RF WAVEFORM does dip in amplitude (voltage). And
: so do the components that make it up. The mod and the carrier
: components combine, and at a syllabic rate do this in a negative
: fashion. This will give you a close to zero amplitude at these
: syllabic time periods.

Wrong. Assume that you modulate a 27 MHz carrier with a 1000 Hz sine wave. There are three frequencies transmitted, all independent. There is the carrier at 27 MHz, a lower sideband at 26.999 MHz and an upper sideband at 27.001 MHz.

A spectrum analyzer will show these three rf signals. A modulation scope will only show the composite power of the three - regardless of the relative levels of the three. It is not showing the frequencies that are being transmitted - only the composite power of those frequencies.

:>Not in your lifetime. One day you may understand what amplitude modulation is.

: Oh I understand just fine. The four watt carrier power at 27mhz
: influences the modulated signal. It does this continuously. Its
: influence never disappears, but it, in itself does.

Wrong. The carrier is present for only one purpose - to raise the modulating signal from audio frequencies to rf frequencies. Once that is done, it is extraneous - which is why SSB works.

: Just as a peak reading wattmeter can take a snapshot of a non
: representation of the whole. So can you take a snapshot of the area
: of the waveform contained within a modulation valley. If you did you
: would find a absence of any power in this brief snapshot. This
: includes any real power at 27mhz, the original carrier frequency

Wrong again. The wattmeter is not frequency selective, which it would have to be to look at the carrier alone.

The modulation does NOT affect the carrier. It cannot, as it is not on the same frequency.

: Remains constant on a spectrum analyzer, but not constant for a
: specified short duration time period.

That is picking nits. The carrier is a sinusoid. As such, it passes through zero watts twice every cycle. But that is independent of the modulation - it will do so even when no modulation is present.

Bill,
Your wasting your time. He's fixated on that scope
and thinks it's infallible. Because he sees the envelope
'narrow' at some point in a sine wave, he thinks the
carrier is varying too. Not enough sense to use his ears.
'Doc

I have a Uniden Washington for Sale $120 + shipping
Excellent Condition has USB/LSB/AM and Lower 40's Regular 40's and Upper 40's via 3 crystals. Also has a sliding clarifier. I'll also throw in a Desktop Cobra Dynamike. Sorry, I can only ship to the lower 48 states via USPS Priority Mail. Thanks!

Chris

Not a problem for you, the 858 washington is long out of production, they were of comparable performance. the 858 may have a slight edge on AM transmit, however the current washington is a very good radio, you will be pleased! I did not comment on the relay problem since you will not be getting that one..... 8719 is the only one you will find new.....

Killrwat, I am getting a used President Washington and I believe it is the older version with the 858 PLL. Sowhat do you know about the relay quirk or anything else about the older version other than it seems to have a broader bandwidth than newer Presendent Washingtons. Is it more desirable than the newer versions?

Bill.

A spectrum analyzer will show four watts of carrier constantly because
it reads a average. It can not pick the portion of the waveform at the
mod null that would show a reduction of all power. If you can find 16
watts on the peak wouldn't you not expect to find Zero watts, or close
to it, at the nulls.?

Sorry Bill, you are wrong. Tell me this To prove the continual existence of a four watt carrier, or any other RF signal, you would need to find the existence of 14.14 volts RMS continually. Continually is the key word. You can not find it continually.

If you don't have 14.14 volts then you don't have four watts. Don't make it any more complicated than you have to.

The envelope is created by RF peak voltages that vary at a syllabic
rate. A syllabic rates envelope is not RF.

>upper sideband at 27.001 MHz.

Bull, There is only one RF waveform that varies in amplitude and
frequency. In doing so it creates these sidebands.You can not have
separate electron paths. They all go down the same road.

>A spectrum analyzer will show these three rf signals. A modulation scope
>will only show the composite power of the three - regardless of the relative
>levels of the three. It is not showing the frequencies that are being
>transmitted - only the composite power of those frequencies.

True. In the frequency domain. Start picking the signal apart in time
domain snapshots and you'll get a different picture.

Your guarantee is flawed. You may go broke.

Just as a peak reading wattmeter can take a snapshot of a non
representation of the whole. So can you take a snapshot of the area
of the waveform contained within a modulation valley. If you did you
would find a absence of any power in this brief snapshot. This
includes any real power at 27mhz, the original carrier frequency

Can you find four watts of 27mhz energy during this brief time period?
Where is the 14.14 volts RMS of this single RF varying waveform
needed to substantiate the existence of any four watt signal, carrier
or complex signal. The influence of the carrier remains constant
through out, but the existence of it, in itself, is modified in
portions of the waveform.

Thanks Bill. Yes the Palomar is in fact one of the blue face mobiles. I will dig into the Messenger and see what is involved. While I am not as technically experienced as some here I believe I can follow your instructions. I am somewhat curious/concerned about harmonic supression without an output filter as the first would fall in the 10 meter band. Then again the twenty meter dipole would hopefully present a high impedance to the harmonics? I'll give it a try and see what happens. Thank you for you help.

I cannot thank you enough for all the information..It has been a big help..Two more questions though..(1) What is a good base linear in the 250 to 500 watt range?? (2) I have always used 2290 pills to drive my big mobile amps..Now I have a 6 pill X-Force and someone told me to go with a driver using (2) 1446 pills..What is the difference??Thanks again..Loren

I'm looking at the MFJ Antenna Tuner. The 949 series is rated for 300 watts. Is that a constant 300w on AM or 300 on Sideband. I thought I heard once that it was only peak SSB & would not handle the constant 300 on AM.

sw

5596. FS: Realistic TRC-212 40 ch Walkie-Talkie

Cross-posted to: rec.radio.cb,rec.radio.swap

I have a Realistic TRC-212 (21-1662) for sale. This is the full size
40 channel unit with carrying case. High/low TX power switch. Around
5 watts output on high. LCD display with TX and receive meters.
Great shape. Original long (around 5 feet) center loaded antenna. Has
external antenna, power and charging connections. Has an 5-pin
external mic connection as well. Uses 8 'AA's or 10 'AA's
rechargeables and you can recharge the batteries WITHOUT taking the
batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.
Great deal ! ! !!
A Picture can be e-mailed.

Homer

BuyItSellIt.com, a newly launched auction, classified ad and want ad site, has made all of it's ads free through June 30.

To attract both buyers and sellers, we have made our services free of charge for the month of June. Users pay no commission, posting fees or other charges for auctions, classified ads and want ads. You can even include multiple images, HTML and longer text information for no extra charges.

BuyItSellIt also offers services that other auction sites have overlooked. Our main feature is our "neighborhoods."

In the signup process, we group our users into communities according to their interests. These people can then interact with others in their neighborhoods using our message boards. Users can ask questions, provide expertise or simply chat about their lives.

We also offer FREE intermember messaging (to protect anonymity), FREE hit counters on auctions, and FREE featured status for ads that receive heavy traffic.

Please visit http://www.buyitsellit.com, sign up for a FREE membership and post some auctions. We want to create a new type of online auction site with your help and input. Any suggestions, advice or other information you can provide would also be greatly appreciated.

Chris Burgess

Generally speaking, the 102" steel whip is the best way to go. Don't forget the 6" spring at the bottom to make the total length 108". I don't thing there is a great deal of difference between whips (stainless steel is stainless steel regardless). Good luck and have fun.

In a previous article, "Dave Musgrave" <musgrave@twcny.rr.com> writes:

Most clarifiers adjust only the received frequency. Some may do both
transmit and receive. It might be worth having someone check to see if your
transmited and received frequency are the same.

In a previous article, "Richard Smith" <rsmith@planeteer.com> writes:

KAOS,
No recomendations for the amplifier. But as far as 'what'
kind of transistor to use to drive an amplifier, it makes
absolutely no difference. The amount of drive power does,
though.

I have been using a whip for years.They do perform great. I have it mounted in the center of the trunk. A lot of people tell me that I wave around alot. Why are whips so directional? I could be giving someone 20 s units and make a turn my signal drops down to like 6 s units. A friend told me the best place to put it would be on top of the car in the center. I don't think I would be able to mount it there.

I agree with you 100 %. Onething that gets me is the people that complain
the most are the ones that are still using rabbit ears for an antenna...lol.
I use my Cobra in the house with a 1/2 wave Dipole. The only thing I did to
the set was reduce the carrier and I using a D-104 mike. I am lucky enough
to live in town homes that are so close together that they look like army
barricks. They already knocked on my door a few times. Wish there was a way
to solve this problem.

Professor,
I agree with you this time! The unfortunate part is that
if you don't know what your measuring, it doesn't make any
difference. Another way of saying it is that if you don't
know what that 'trace' represents, you might think that a
carrier is variable on AM.

Moskal's,
For what it's worth, you adjust all amplifiers the same way. Just don't over drive it.
The 'adjust' control is probably for a 'relative' meter and keeps the 'reading' on scale.

It seems to me that the Professor is describing what happens in the time
domain so an oscilloscope would be an appropriate tool.

The spectrum analyzer also shows the sidebands to be unchanging.
Something is changing. We saw it on the oscilloscope.

(just being the devil's advocate)

In the context inwhich it is used, of course the 'envelope'
is RF! If it isn't, why are you 'looking' at it?

> Bull, There is only one RF waveform that varies in amplitude and

An RF waveform that varies in amplitude and frequency, when
speaking about an AM signal, is called distortion. Sort of like
an FM transmitter with a severely under rated power supply. Or,
An AM transmitter with an unstable carrier oscilator.

Of course you will, but your insistance in this matter only
shows your lack of knowledge about amplitude modulation, and
makes me suspect your knowledge of RF matters in general.

I know if they built an amp and tried to key it the so called say"2 Pill"
class it would be against most of the rules at a lot of keydowns. the people
at the breaks won't the vehicles to run comparable transistors to keep it
fair.

You remember about that, "nonrepresentation of the whole",
thats also what your looking at on that 'O-scope'! Could I
find a 14.14 volts at a negative modulation peak? Yes I can.
All I'd need would be a receiver in SSB mode, and one ear, to
listen to the signal.
Tell me again how something can remain 'constant through
out', and it's 'existence'...'is modified'. Sounds like a
contradiction to me. Are you sure that's what you meant to
say? I think you 'brained your damage' once too often.
(to whom it may concern, please excuse the plagerism. No
comparison was implied! It just fits.)

> portions of the waveform.

Well said.

Even the carrier power is not constant or it wouldn't be a carrier.
With all this talk of "A + B", 'A' is merely the magnitude of the
carrier. The carrier is A cos(w). The average power is constant;
the instantaneous power is not.

Many arguments have referred to the spectrum analyzer to view the
frequency domain. But the frequency domain requires a periodicity
which implies a period for an average reading which is constant.

This is a somewhat humorous debate. In a way, both sides are correct.
The magnitude of the carrier frequency is constant -- but the waveform

dips instantaneously because of cancellation by the sidebands -- but the sidebands wouldn't exist without varying the amplitude of the carrier. So which is it? Which came first, the chicken or the egg? They are both basically a description of the same thing.

There is one difference between each side that is prolonging this debate: the absolute definition of carrier.
For those looking at the time domain, it is that amplitude-varying signal that looks like 27 MHz. They know that, if you could count the cycles inside the envelope, it would be exacly 27 MHz.
For those looking at the frequency domain, it is that center line exactly at 27 MHz. They know that any variations in amplitude create frequencies on each side of the 27 MHz which are not carriers.

So, is a carrier that absolute frequency that cannot contain any variations in amplitude? Or is it that signal that is varied in amplitude to transmit information?

It depends how you look at it.

You have two choices, one would be add crystals, might be kind of tough to find them, unless you special order. The other is the VFO, I've owned a large number of VFO's, in my opinion The Slitronix is the least desireable, yes they look nice, and have better frequency coverage, but they are also the least stable! They drift, even after a reasonable warm up period. The Pal offers coverage up to about 27.515 or so, it can be readjusted to go up higher, but then you lose the bottom, even though the Pal offers less coverage i find it much nicer, its definately more stable! you will need to match the VFO to the radio, regarding output Frequency, off hand i don't recall the model you will need. someone else perhaps can help you on that. If you get no answer as to wich one you need i'll dig through my papers and come up with it for you. One other choice and probably the nicest of the bunch is a Glenn 326g digital controller, They are fairly stable and will go anywhere, it also has an adjustable frequency output. A copy of the Glenn just went without a bid yesterday on Ebay, fellow had an opening bid of $50.00 on it... The glenn is fully programmable and can be used as a frequency counter.

Remember whatever choice you make most of the old 23 channel bases will only go to about 27.5 or so without realignment...

Welcome to the world of compromises!! If it were just length is better, everybody would drill the top of their roof and put a 1/4wave whip up there.

But seeing as how my ex-wife was a better shot with the 357 than I was (although she couldn't hit moving targets the way I can, and that would have meant keeping running!) I couldn't drill the car for my antennas.

So it's compromise time. Decide how much degrading of performance you're willing to live with as you start moving from the optimum antenna in the optimum location.

And remember, it's sometimes a question of external influence, like the 357. Or lack of external influence as "You did what?" to the car and you sleep on the couch for a few nights.

(Hey, I'm divorced, I can joke about that. Hmm, what joke?)

In simple terms modulating a carrier is like turning a carrier valve
on and off. In doing so you not only form a modulation envelope but
you get side effects.These side effects could be termed distortion.
The distortion is the sidebands.

A = carrier power at the crest
B = carrier power at the null

8A + 0B + 8A + 0B + 8A + 0B = average of 4
4A + 4B + 4A + 4B + 4A + 4B = average of 4

> properly.
>
> cheers
> skipp

First, owning 3 or 4 Palomars DOES NOT make the one the last word in Amplifiers! At one time or another I've owned every Palomar Amp there is from the Pulsor to the 350Z, does NOT make me an expert.... I do however know the proper way to tune a Palomar Skippy's version will work, but its not correct! Personally I find Bill Eitner's responses to be the most accurate and helpfull! Skippy is an unproven voice in my view... This response to you and one he recently posted stating that THE FREQUENCY OF A LINEAR AMPLIFIER CHANGES, makes me have serious doubt as to his technical expertise! His outlined method of tuning the 300A in short version is tune all controls to max and then detune the amp. now he does not state if this

is done unmodulated, i'm guessing that was his intention. This method will yield a Backswing on a Bird non peak reading meter, unless you de-tune it quite a lot, wich could and most likely will leave the Amplifier out of resonance.. Bill's suggested method is correct and when done properly will yield maximum modulated power.

If you called them they would probably tell you it is for 300 watts ssb PEP, but forgive me for asking why you feel you need a tuner? The band is pretty narrow now. You should be able to tune the antenna fairly low and keep it in the green from top to bottom. The tuner only tricks the radio into thinking that it has a match. Nothing can beat a properly tuned antenna.

Source record: 39475

Hello KOAS: The 57 foot tower is quit a thing to have for all the radio stuff. Suggest you use a 4 or 5 element beam, rather that a 3 element beam. I would say the tower and effort to install the antennas would justify the use a larger more better beam antenna. Maybe a cross type antenna like a MaCo Laser 400 or 500 that is both vertical and horizontal polarized would work for you. The Laser 400 and 500 are much like the Moonraker 4 and 6 element antennas. I used a 4 element Moonraker for years and it always amazed me how well it worked, in gain, rejection, and figuring out were certain people were transmitted from.

Suggest you pick out your antenna system, install it for a few days and only listen in, do not transmit. I have done this, and neighbors who started to complain, were told that I wasn't even transmitting. This kind of flushed out the "spring loaded to complain" group. Next, after a week of swinging the beam antenna around, I transmitted stock or barefoot for a few weeks. No body complained. Then I used better equipment.

I had a few weeks later, a phone interference problem next door. I supplied them with phone filters from Radio Shack, and no more problem. Its always better to be a good neighbor. If I needed to I was going to hire a professional phone installer guy to fix and install RF proof phones in the neighbors house.

If your gonna run a amp, use a clean one. I see a lot of guys use Ham type amps. The old out of production Pride 300 DX was a good clean one. But with just a few watts on SSB, and a good beam antenna, you talk all over the place. The ARRL has books on RF Interference, and they are great.

To be honest with you DUK, ever since your first post i've found your logic hard to follow!!
Its not a copycat of someone, it is a redesigned amplifier BASED ON motorola engineers..... In reality copys tend to improve the pruduct!
Get real, a car is a COPYCAT, as you put it???? because they are all based on the original #1 car?
AGAIN WHO CARES IF ITS COPIED! because basing an opinion on the fact an amp builder copied another is faulty logic! An amplifier or its builder should be judged by his product, and his products performance!

KW
---

i don't care if its copied , i use an x-force and they have improved a great deal since 123 first copied davemade .

the origional poster was making like dave-made was an origional uncopied design , and as i and a few other pointed out its not .

#22 north central illinois mobile

Wow.............. This is the most BASIC stuff.

Just what do you think a Peak reading wattmeter reads?

Does it not do exactly what I stated above? Does it not read 16
watts?

No. You are assuming again. I did not define the type of frequency
change. The Zero voltage crossover points are still at the carrier
frequency time period.

IN DSB AM with a single frequency modulation there are two frequencies that will change as a result in the change of the power of the modulating frequency. They are the Upper and Lower sidebands. There are no frequency shifts that occur. The sidebands on AM are not produced by frequency shifts. If so then that will be FM and not AM.

What an old tired myth. Antenna tunners match the the ouput impdance of the
radio to the load. One comes built into every radio. It is how you match the 2
or so ohms output impedance of a transistor to a 50 ohm antenna. The only
trouble with tunners is that they can be misused. They will either allow you to
load a 50 ohm radio into a 100 ohm quad or let you load into a 10 ohm short.
You have to know what you are doing.

****

The envelope is a result of a mixing or product of two different frequencies. On a o'scope you are seeing the products of the mixing of audio and a carrier. The scan rate is set slow enough to see the audio rate change. Thus the familiar envelope or waveform of the modulation process.

james

*a textbook.
**********8

Not really. I have had great difficulty in trying to simplify the theory in such a way that you may be able to understand. Now I have two that seems to fail to correlate what they see to what is really happening in real time.

I have Mathcad that can show the mathematics that will prediuct exactly what will happen with 100% modualtion. Trying to find a way to present it here. I doubt many have Mathcad and I fear most will not download a Word document for fear of a macro virus or some other nasty infections. So I am left with a only means of revealiung knowledge is through pictures. That will take some time. Maybe with pictures I can make things simple enough that all will comprehend what is very simple electronic theory and practice.

Just where is it that I said the carrier contains information?

What language do you speak? The language of misinformation?

An Astron RS-20 would do the job just fine. A little cheaper would be the
Pyrmid 25 amp.
There are a lot of brands and every one has a different pref...get one with
at least 16-18 amp
continuous duty and 20-25 amp surge.

No, You said that. You are assuming again.

It;'s to bad you can't figure out how a waveform can cross the
zero line at the carrier time period and still contain the sideband
information. According to your self proclamations I would think that
you would be perfectly capable of figuring out how this is done.

As far as I know, both are still modifyable (the 2950DX and
the 79-290). I just modded a new 79-290 today and it worked.
It didn't tune up as easily as I would have liked, but the
frequency expansion mod worked properly.

The original instruction book says you can tune for maximum peak power
instead of the drawn out procedure you outline below. The result is
the same. I too have owned my share of 300As and I know that tuning
for peak output results in proper amplifier operation. Also, since
they are of the grounded-grid design, they are not as easy to overdrive
as you think they are.

One of the reasons the 300A has stood the test of time is because it
doesn't have to be babysat.

Thank you, I think I will.

To bad you're getting lost again. I can always tell when you're losing
it. You try to make something more complex than it has to be. Good
lawyers do this too. They complicate this issue in an attempt to sway
the jury into believing that they know what they are talking about.
To bad it doesn't pertain to the truth.

Right now I have a 1/2 wave dipole hanging from a tree. My question is, if I build another one and connect the to together with a center feed connector will this work? I need to know how long of a piece of coax do I use between the two antennas? Is it true that by doing this that I will create a bean causing my antenna to be directional?

hello.

i've heard all kinds of good things about the wilson 1000 and wilson 5000 antennas. however, how does a fiberglass antenna such as a firestik, or a fiberglass made by wilson or k40 compare? i've read that top loaded antennas are supposedly better than base loaded antennas. is this true when comparing the wilson 1000 (base loaded) to say a 4' firstik II (top loaded)? just wondering, since a fiberglass antenna seems to be sold for less than $20, while a wilson 1000 is much more than this.

Guys, please remember that AM is a mixing process. If you examine a high level (plate) modulated transmitter, you are applying up to an additional 1/2 of the carrier power in AUDIO power. In other words, you need 50 watts of audio to high level modulate a 100 watt carrier. The mixing process will produce the SAME 100 watts of carrier - PLUS another 50 watts (25 watts in the lower sideband and 25 watts in the upper sideband). The same applies with low level modulation - you will still end up with 100 watts of carrier plus 50 more watts of RF - 25 in the upper and 25 in the lower sideband. If you measure the voltage on the 50 ohm termination (or antenna) and calculate power from that, you will see 150 watts - BUT ONLY 100 of these watts are the carrier - the rest is contained in the sideband information (whether supplied by that 50 watt audio amp in high level modulation, or created in low level modulation).

If only the carrier varied in amplitude and no sidebands resulted (won't happen, mathematically), you could listen to hi-fidelity with a 100 Hz bandwidth. It doesn't work that way. Am requires perhaps 6 KHz of bandwidth. This is why we use single sideband. We have reduced the transmitted bandwith by over 50% and can reduce the receiver bandwidth similarly (and knock out a lot of interference). Oh yes, and reduced the transmitter power from 150 to 25 watts without losing ANY effective communications power (or, we can increase back to the 150 and have it all in the single sideband, for a 6 times increase in effectiveness).

Now FM gets more interesting. Selecting a frequency tone and the proper deviation, we can create a modulation index where the carrier totally disappears! Of course, there is still RF out there; it's just that all the power is in the sidebands and NONE in the carrier!

73s, Jim

>would already have built one.
Not strictly true.

There are no doubt some limited production 'special' devices that have
been produced over the years that are not on general sale.

If say for example they had higher gain, the end result is that you'd
need less current for a given output and that guy would win when things
were pushed to the limit.

Here's a tube few have heard of as it's not in your average Eimac
catalogue, the YC-156

Go look at one at: http://www.angenent.org/w7iuv/amp-pix.htm

No base needed, it bolts right to the chassis.

6.5Kv on the plate, 15V @ 15A heater and 100w in gives a cruising 10Kw
out. You guys would see two or three times this power out.

Cheap pulls available at only a few hundred dollars a piece.

If you've never heard of it does not mean it don't exist.

Phil / UK

: Thanks in advance,
: P.S just looking for a free education

Hi John Doe... I kind of like that.

Any time you ask questions about amplifiers, a mixed bag of information floats in from all types of people. Here's a few opinions of my own...

Unstable could mean a poor design, a poor quality of construction and or the use of poor/cheap parts that often fail when their ratings are exceeded.

Poor design is a topic unto itself. A lot of "CB" amplifiers are made for a quick buck by the builder/seller. These units often use shortcuts in design to keep the costs low. They end up going poof real quick...

Another real popular trick is to use a past known amplifier mfgrs name in a new production. Manufactures like Palomar CPI and CMI are long out of business, but you see current new amplfiers sold with these brand names. That's all about using the name of an old mfgr... sometimes the products are just find... some times they're real crap.

Yes, an amplifier can drift "off frequency"... A lot of amplifier hacks will throw a circuit out that has cheap parts or the above mentioned poor design. All amplifiers generate heat during operation. A lot of heat changes component values around. This would detune amplifier sections, especially in the impedance matching sections, the low pass filter and other areas where values should be stable.

Depending on how well the amplifier is built... a failure may just mean the fuse pops. A well built amplifier has failure protection built into the design. I've spent hours designing circuits to minimize damage when the parts fail or a glitch occurs. The repair then becomes a simple procedure outlined in the owners manual or using regular trouble shooting methods.

A hack amplifier may end up buring down your house if you can't stop the damage fast enough. It's happened more than once, I'm sure. Hopefully, a failure of any amplifier can be controlled, sourced, repaired properly and returned to smart/legal operation without a lot of grief.

One last thing, the most important... those cheap'o amplifiers you see often put out a lot of distorted signal that causes interference. Good

amplifier design and operation is no magic, others should just hear a clean loud signal at the other end.

cheers
skipp

Vector addition would provide a sum; multiplication provides a product.

So how do CB's create a modulated signal?
By adding sidebands to the carrier? No (at least, not directly).
They vary the carrier amplitude. It is vector multiplication
that creates the same net effect as your vector addition.

: Hi,
: I recently purchased a Palomar Tube Base amp and I'm not exactly sure
: how to set the Tune and Load. I also have a pot in the back upper right
: hand corner to tune to max power. I think it's a Palomar 300A but it
: doesn't say that anywhere. It's got the chrome top. Thanks for your
: help.

Hi Larry,

Don't follow that other guy's post is the first thing you want to do
for yourself...

Welcome to the happy world of 300A owners... I have three or four myself,
various vintages of production. A nice amplifier with the option of 10
through 40 meter amateur bands. (hopefully you have the multiband model)

First get a dummy load (termination) that will handle at least 400 watts
power. You really should have one around anyway. Same with a watt meter,
but you can use the amplifier front panel relative output if you like.
Best to have a quality watt meter around if you can.

Set the amplifier to the low power level, into the dummy load and key the
radio. Adjust the front panel controls, tune and load for max
forward power out on your external watt meter. Unkey the radio...

In the low position, you can drive the 300a with up to 60 watts, I don't
go past 40 from personal preference. Your only using the four main output
tubes direct while in the low power mode. The two drivers are just sitting
there.

If you have the 300a with six tubes, the above is correct... If you have
the four tube amplifier, max input is only 4 watts at any switch setting.

Still using the dummy load, switch the amplifier to high power. NEVER,
EVER DRIVE THE PALOMAR 300A WITH MORE THAN 4 WATTS AM CARRIER IN THE HIGH
POWER MODE! Not only will you trash the driver tubes, but your signal
will splatter across the band real.... real bad.

So your 4 watt max am carrier keys the 300a in the high power mode,
quickly adjust the rear panel control for max power output.

A few quick max power adjustments of the front (tune/load caps) and rear
panel control (driver tune) will yield slightly over 300 watts carrier
power with 4 watts input.

Then the front panel load control is rotated slightly to increase the
loading of the amplifier (makes it much more linear). I'll have to refer

to my notes to give you the direction. It's a proceedure printed in the original paperwork.

All the above is done into a proper termination. Once your sure it's up to snuf, you can change over to a properly matched/tuned antenna and readjust the loading capacitor for operation on the air.

Original Palomars Amplifiers were well designed and reliable when operated properly.

cheers
skipp

My guess is no, because you would still be driving both antennas. Get you a antenna switch so you can chose between either of them without unhooking anything. Thats what I have done, it works great.

Source record: 39567

The old 4 pin, 2 buttin 858 PLL President Washington is a FAR better talking radio than the later model. The later model is OK, don't get me wrong, but if you get ahold of someone that can really work on of those old rigs, it will flatten any newer Washington, or Cobra 2000.

The relay chatter was a piss-poor design consideration, and can be fixed very easily. The great brains at Uniden used a tantalum cap as part of the filtering circuit for the final and driver's collector voltage feed. Theese things do not like RF at all. All you need to do is to replace it with an elecrolytic cap of near the same value (.1 uf, 16v) the voltage isn't important, as long as it's at least 16v. The cap in question is either c175 (according to my schematic) or c179 (in my radio). It's a little blue cap in the back, about an inch from the back edge of the board, and an inch and a quarter from the left edge of the board. It is located between two connection points that will both have white wires connected to them (TP4, TP2) Just pull it and replace with the electrolytic, paying attention to polarity. The tantalum caps are usually marked on thier+ side, and electrolytics on the- side. If you can't get the electrolytic, a ceramic cap will also be fine.

If you need any other mods on one of theese rigs, email me, and I'll be happy to share them with you. I've never actually owned a Washington, but I've had at least 5 or 6 radios with that same circuit board. I currently own 2, a Robyn SB 520D, and a Robyn SB 510D. On average, when tweaked and tuned and all that good stuff, one will dead key 2 watts, and swing 10 to 12 watts RMS on a Bird wattmeter. The audio is super loud, and very clean (with a good microphone). 73's

Doesn't need to be in the trunk, you can mount it right next
to the radio. Or where ever.

Ok, only problem is, no such thing as an original! they are all
variations on an original design! So technically Dave is not an original
either! sure, might be some design improvements, but the thing still dates
back to Motorola engineers original design!!

The location of the antenna is your answer, the vehicle body shapes and reflects your signal. your center of the trunk mounted whip would have a major lobe to the front of the car, and two minor lobes on either side. If you wanted your antenna to be the least directional on your vehicle you would need to mount it in the center of the roof.

If you have a Field strength meter you can get a rough estimate of your antennas radiation pattern. mark off equal distances (from the antenna) all the way around your vehicle, take field strength measurements all the way around also. write down your results should show you a polar plot of your antenna when your done....

typical patterns

left rear bumper, max signal to right front
right rear bumper, max signal left front
center of trunk, max signal front
center of roof, close to omnidirectional as possible for vehicle

Skipp,
I've got two questions.
How does an amplifier 'drift' off frequency?
How can you have legal operation with an amplifier on CB?
Please answer in any order.
'Doc

5736. Cobra 135 and VFO?

Newsgroup: rec.radio.cb
Date: 2000-06-13 00:00:00 UTC
From: grtpmpkin32@aol.com

Source record: 39573

I've just (quite cheaply!) acquired a fairly good-conditioned Cobra 135... I am wondering if I could/should use a VFO like one from Pal or Siltronix to get a little more channel flexibility; and if anyone has any experience with this sort of thing I'd really appreciate the help.
Someone had told me a while back that I needed a Siltronix Model 90 or some such animal? Anyway, this is a good looking, oldie-woodgrain CB and I'd be proud to have it working again!
Thanks for your time-
Linus

It is a 'difinitive' answer. 'Yes', the carrier is still
there. 'No', the carrier does not change in amplitude.

> a varying power in the time domain?

Easy. The frequency domain *requires* a periodic signal. It gives
average power per period.
The time domain has no such requirement. You can look at any arbitrary
sub-period.

> If you make that claim then the Fourier and the inverse Fourier transform
> will not hold up. Thus you will not be able to transform back and forth
> between the time and frequency domain.
>
> james

No such claim is being made. The Fourier transform has its limitations.
The biggest being the fact that the signal must be periodic. When you
start looking at sub-periods, you get undesired results; you can get all
kinds of frequencies when you introduce a discontinuity. The Fourier
transform is always a reversible process but you have to understand what
it provides.

> and amplification level.....

In order to use any commercial 160m-15m HF amp on 10m, you have to "homebrew" the 10m section to enable it to operate. If you had to buy parts for this, I imagine the company would want to see proof of a ticket. There are NO external amps legally sold for use from 24 to 35 mhz.
Period. There are NO amps sold for use below 144 mhz that are not "certified" in the fcc database. Except for 1 a year that a ham can make and sell if he wants. A non ham can not build and sell an amp that operate below 144 mhz without certification. Period. There is no "type acceptance" for external power amps anymore. They must have a "grant of certification" in the fcc database. MK

You left out that important qualifier "over a brief time period."
Actually, some spectrum analyzers can window a brief time period.
And they will show a lower carrier level.

Zero beating is as accurate as you can get. The other part needed for
accuracy is a properly aligned radio. If you are concerned about this
then use a "real" amateur radio that has TX and RX tied by default.

> (just being the devil's advocate)

You're right in saying the spectrum analyzer shows no change,
but only if the modulating signal producing the sidebands is a
constant as in a sine wave. If the modulation was a complex wave
form such as speach patterns, you would see changes in the side-
bands which 'follow' the modulation excursions in both X and Y
axis of the spectum analyzer (frequency & amplitude). Now you
see it on the 'analizer'.

Wrong again. 1000 Hertz equals 1000 cycles per second.
A cycle is not equivalent to a cycle per second. The units are
different.

Since when? 1000 cycles/sec equals 100 hertz

A 1000 cycles is a 1000 cycles.

>;-)
In simple terms modulating a carrier is like turning a carrier valve
on and off. In doing so you not only form a modulation envelope but
you get side effects.These side effects could be termed distortion.
The distortion is the sidebands.
```

A envelope is formed by RF. It is not in itself RF.

No. You are assuming again. I did not define the type of frequency
change. The Zero voltage crossover points are still at the carrier
frequency time period.

> 'Doc

I am glad you finally agree.

My insistence in using time domain snapshots is not a sign of
suspect knowledge. Rather your insistence that this method of
analogy is wrong is what is suspect. After all, just what is it that
a Peak reading wattmeter does.. Doesn't it take time domain
snapshots? Are these snapshots suspect too?

Was not the original thread about the carrier changing size?
Doesn't 14.14 volts represent a four watt carrier? Wouldn't the
absence of 14.14 volts prove its non existence? How else
would you prove it without using time domain snapshots?

Speaking of time domain snapshots. We already know that a 100% sine wave modulated four watt carrier contains six watts. Two are attributed to the sidebands and four are attributed to the carrier. If you take a time domain snapshot of the top of the modulation envelope what do you get? You get sixteen watts.

16 watts minus 6 watts equals 10 watts. Where did the ten watts come from? I'll let you answer this one because "you insist on my knowledge being suspect"

****

I beg to differ here. radials around the tower will not improve a yagi's performance significantly. The higher up the less the improvement. If the yagi were say 5 feet above ground you might see some improvment. At 57 feet, I would be surprised if more than a 0.25 Db improvement were made. Not worth the effort or cost.

I think you had better quit while you can.

I hope I understand your comment that you made,as enclosed in this post.

You are trying to state that during modulation there is one frequency waveform
that is producing the sidebands and it is changing in amplitude and frequency?

If so then what is that frequency waveform?

How is it producing the sidebands?

I state again.

The power in the sidebands of a double sideband large carrier AM signal will
vary in power in direct proportion to the audio power applied in modulation.

I know this may sound a little complex but it is not rocket science.

james

I have bought the Wilson 1000 trunk mount antenna and it works really well. It is
a nice antenna and I also use a Uniden Grant LT. The antennas have not changed
much over the years except that they look alittle different because they build them
to handle huge power outputs these days. That means a larger gauge wire for the
loading coil and thus the bigger fatter antenna base. Also magnet mounting seems
to have become very popular these days.

I highly recommend the Wilson 1000. It is just is a plain winner and a sure shot
to spend your money on.

Bill.

Okay.
If you are so anal retentive on one specific case where the cosine of the modulating frequency equals -1, then yes, the sum of the total instantaineous power of an AM signal is equal to zero. This will occur at intervals of 2*PI. It still does not detract from the fact that the average power of the carrier still will remain constant. Why the affixiation for one point in a complete cycle is so impressive, I fail to understand. But if one wishes to reside in such a tiny sliver of time then so be it.

x(t)= A*cos(Wct)+ A*cos(Wmt)*cos(Wct)

where Wct is the carrier term
and Wmt is the modulation term
and A is the carrier average power

When the cos(Wmt)= -1 then and only then will the instantaineous result equal zero. This will occur when the modulation index is 1 and at 2*pi intervals starting a pi.

AM is not like turning a carrier on and off. You imply that information can be transmitted in the carrier. It is not. The implication that distortion is in sidebands leaves one to believe that the carrier is the main source of information. The carrier never changes it's average amplitude. An AM signal is not just a carrier. It is the carrier and the sidebands produced from modulation. There are always three components to AM. The sidebands are produced by the product of the carrier and the modulation frequency.

now if you carte to explain what " There is only one RF waveform that varies in amplitude and frequency" means, then I may be able to alter my understanding of said statement.

From what you have posted in other articles and this comment I feel you have the firm belief that the carrier is changing in amplitude and that any shift in frequency of the carrier is causing distortion in the sidebands. No where in any of your posts do you even hint that the audio frequency comprises the sidebands. I feel that your understanding is poor on what is happening in an AM signal simply because you lack the mathematical knowledge as to what is truely happening. Your knowledge appears to be fixed on just the o'scope trace and what is happening there and not understanding the math as to what is truely happening. I have posted in another comment back to you what I feel you are truely arguing about. I think you should read it and try and understand it. Nowhere in any of my posts have I stated that the instantaineous power ever remained constant in an AM signal. I have always maintain and still maintained that the average carrier power in an AM signal will remain cosntant. ANy beginning engineering student will know that a sinusoidal signal will have points in time where that signal will equal zero. The main understanding is that an AM signal is comprised of three parts. When looking on an o'scope when the resultant of all three signals equals zero does not mean all three are zero. It simply means the combination of all three are zero. In the case of an AM signal we have a product and a sum. In order for the resultant to be zero the the product of two terms must be equal to the magnitude and 180 out of phase from that magnitude. In AM we have a product of the carrier and the modualting audio. This product is then added to the carrier term. Thus for the resultant to be equal to zero, the product must be the minus value of the carrier. ie

T = cos(A) + cos(A)*cos(B)

for T = 0 then A must equal zero or A*B must equal -A. The only time that happens when B= -1.

If A is the carrier then the carrier can never be zero. If the carrier were zero then no matter what power level B is at it will never be transmitted as the carrier is zero. Secondly in the equation there is no power acting on the pure carrier term to take it's average power to zero. Since cos(A) is the carrier term. If you expand out the cos(A)*cos(B) term by a trig substitution you get the following equation:

T = cos(A) + .5*[cos(A-B)+cos(A+B)]

From this we now see that the two sidebands, cos(A-B) and cos(A+B). These are formed simply by adding and subtracting the two frequencies. Again ther is still no power acting solely on the carrier term. The example here has the following preconditions:

1) the modualtion index is 1 that is 100% modualtion.
2) the carrier power is 1.
3) the carrier power is greater than the modulating power.

regards
james

Oops! Folks! I re-examined the block diagram schematics for the Uniden Grant XL and see that the GRANT XL and LT are indeed Double IF Conversion receiver designs on AM but
they are only Single IF conversion for SSB mode.

Whereas the Uniden Washington base station is only a Single IF conversion receiver design for
both AM and SSB.

Hmmmmm~! That means I was right on my very first post. that the Uniden mobile rigs have a better
receiver designed into them than the Uniden Washington base station rig. So they are different, the
Washington base vs. the Uniden Grant LT / XL.

Personally, I'd like a more correct answer.

At the bottom of the modulated crest (per the above requirement),
the voltage stays close to zero for many cycles. You will not
find four watts there.

What if I 100% modulated my signal with a 1 Hz square wave?
Would I not see 1/2 second of no power followed by 1/2 second
of four times the power?
Would you say that there is power for the full second?
Would you say that the carrier is there for the full second?
What would the spectrum analyzer show you?
Now, change the 1 Hz to 1000 Hz. Does the spectrum analyzer
show any discontinuity in power? Why not?

FOR YOU FRANCES...
Well actually this was sent to me by a lady friend.....
HAVE FUN
Remember now all in fun, heck I don't make this stuff up!!!!!

Why did God create woman?

To carry semen from the bedroom to the toilet.

If the dove is the bird of peace, what is the bird of true love?

The swallow

How do you annoy your girlfriend during sex?

Phone her.

Why do women fake orgasms?

Because they think men care.

What is the definition of "making love"?

Something a woman does while a guy is screwing her.

What should you do if your girlfriend starts smoking?

Slow down and use a lubricant.

What's the difference between oral sex and anal sex?

Oral sex makes your day, anal sex makes your hole weak

How many sexists does it take to change a lightbulb?

None, let the bitch cook in the dark.

What's the difference between pre-menstrual tension and B.S.E?

One's mad cow disease, the other's an agricultural problem.

Why does the bride always wear white?

Because it is good for the dishwasher to match the stove and refrigerator.

What do you say to a woman with 2 black eyes?

Nothing, she's been told twice already.

How many men does it take to open a beer?

None. It should be opened by the time she brings it

How do you turn a fox into an elephant?

Marry it!

What is the difference between a battery and a woman?

A battery has a positive side.

What are the three fastest means of communication?

1) Internet

2) Telephone

3) Telawoman

Why do hunters make the best lovers?

Because they go deep in the bush, shoot more than once and they eat what they shoot.

How are fat girls and mopeds alike?

They're both fun to ride until your friends find out.

How are twisters (tornadoes) and marriage alike?

They both begin with allot of blowing and sucking, and in the end you lose your house.

Why does a bride smile when she walks up the aisle?

She knows she's given her last blow job.

What's the difference between a bitch and a whore?

A whore sleeps with everyone at the party and A bitch sleeps with everyone at the party except you.

Why is the space between a women's breasts and her hips called a waist?

Because you could easily fit another pair of tits in there.

Do you know why they call it the Wonder Bra?

When you take it off you wonder where her tits went.

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

You mean constant *average* power.

By the way, how is audio power constant if it is not DC?
Isn't "constant audio" an oxymoron?
Audio power isn't constant but it can have a constant average power.
It can be constant in the sense that periods repeat but it is
not, at the lowest level, constant.

Sound familiar? ;-)

: Actually, some spectrum analyzers can window a brief time period.
: And they will show a lower carrier level.

Big deal. As I have stated before, the carrier is a sinusoid. As such,
the voltage passes through zero twice every cycle. If you want to call
that a "lower carrier level" - do so. But it is not proper usage of
the term, as a partial cycle does not make a carrier wave - it just makes
a noise impulse.

Anyone can create a book or web page, and write anything they want. It
does not make it true.

You can disprove this by simply listening to an AM signal on SSB. You
will be able to hear the carrier (if you tune off frequency a few hundred
Hz - or the AM station is already that far off). It will not matter
whether the transmitted signal is a dead carrier or a modulated signal,
the volume of the carrier will not change.

Your monitor scope is worthless for viewing the carrier - as it is not
frequency selective. All it shows is the composite voltages of all the
transmitted signals.

: it reads a average. It can not pick the portion of the waveform at the
: mod null that would show a reduction of all power. If you can find 16
: watts on the peak wouldn't you not expect to find Zero watts, or close
: to it, at the nulls.?

A spectrum analyzer shows peak voltage - which can be calibrated to show peak power.

Again, it has been explained many times that the instantaneous power of the carrier can be zero. So what? It is a sinusoid - not a pure DC signal.

If you look at a few waves of carrier signal, you will see that the zero crossing of the carrier only occasionally occurs at the same instant of time as the zero crossing of the modulation. The two are totally independant of each other.

Do you know how a signal is created to check the modulation of a SSB transmitter - seeing that no carrier is present? You inject two audio signals into the modulator - one at a low frequency (which acts as the modulation) and one at a much higher frequency (which acts as the carrier). You now get the same type of waveform on the monitor scope that you get with a carrier and single tone modulation.

There is no carrier involved - yet the monitor scope will allow you to calculate the peak power. If you hook up a wattmeter, it will show you the power (RMS or Peak depending on the meter). If you look at the signal on a spectrum analyzer, you will see two peaks - both of them on the same side (frequency wise) of where the carrier would be if one existed for a SSB signal.

I certainly can - at the carrier frequency.

: If you don't have 14.14 volts then you don't have four watts.
: Don't make it any more complicated than you have to.

If you are talking about the sum of the voltages at all the frequencies, then you are correct - they sometimes go to zero. This is what you see on a monitor scope - which is not frequency selective.

But the scope is useless for looking at the carrier in isolation when there is a modulated signal as well - so any arguments using the scope as a basis is worthless.

Use a spectrum analyzer (which can show relative power - regardless of what someone claimed) and you will see that the carrier RMS (as well as Peak power) remain constant - with and without modulation.

If you cannot get access to a spectrum analyzer, like the one I have on my test bench here at home - or the far better one I use at work - then simply haul out an older copy of the Radio Amateur's Handbook, where they discuss AM signals.

: Personally, I'd like a more correct answer.

: At the bottom of the modulated crest (per the above requirement),
: the voltage stays close to zero for many cycles. You will not
: find four watts there.

Only on a modulation scope - which does NOT model the real world. This
has been pointed out many times.

On a spectrum analyzer, the voltage will NOT stay close to zero for
many cycles - either in the sidebands or the carrier.

: What if I 100% modulated my signal with a 1 Hz square wave?
: Would I not see 1/2 second of no power followed by 1/2 second
: of four times the power?

Forget this single cycle stuff. It is meaningless confabulation.

: Would you say that there is power for the full second?

Yes.

: Would you say that the carrier is there for the full second?

Yes.

: What would the spectrum analyzer show you?

It would show the carrier, plus a whole lot of sideband - that
square wave would generate a tremendous amount of odd order
harmonics.

: Now, change the 1 Hz to 1000 Hz. Does the spectrum analyzer
: show any discontinuity in power? Why not?

Only if you look at instantaneous power, which again is meaningless.

:>
:>Oooh, good question!

: I believe that is why it goes unanswered.

I answered it in a previous response.

There is no such thing as "1000 cycles located at the bottom of the
modulation crest". It appears to be that way in a monitor scope, but
that is an artifact of converting the multiple real frequency domain
signals into one artificial composite time domain signal.

The modulation sidebands are completely independant of the carrier, which
is why SSB works. As such, neither affects the other, once the sidebands
have been generated.

Unless you can grasp these simple concepts - which are covered far better
than I can in any introductory text on RF modulation - it will be a waste
of time to continue.

The spectrum analyzer we used for CATV
was able to see the whole group of
channels or zoom in to the video
carrier, sound carrier and color carrier
or zoom in further and see the deviation
of the FM voice and the AM modulation on
USB and LSB o the AM carriers. You can
also use it to verify the proper levels
and phase of of the carriers relative to
each other.

It is required by the Federal CRTC to
have the channel quality with in a
certain range.

That unit was $12,000. So you got the
bucks you can see anything literally!
Cheers,
John

I had considered that, but how would the recieve track with an external VFO? My Titan has an Xtal/Manual switch for the recieve, but on Xtal, I don't hear anything besides some hissing. There is a crystal socket on the front of the radio, and when something is plugged into that, I hear some static, but nothing else. Is that what it's supposed to do, or is something wrong?

PS. wherebouts are you from? I know there's a fellow in Delaware that goes by Killerwatt, and I was just wondering if you're him.

*you get side effects.These side effects could be termed distortion.
*The distortion is the sidebands.
****

Not hardly. In AM there is no information in the carrier. It resides solely in the sidebands.

*> Can you find four watts of 27mhz energy during this brief time period?
*> Where is the 14.14 volts RMS of this single RF varying waveform
*> needed to substantiate the existence of any four watt signal, carrier
*> or complex signal. The influence of the carrier remains constant
*> through out, but the existence of it, in itself, is modified in
*> portions of the waveform.
*
*Well said.
*
*Even the carrier power is not constant or it wouldn't be a carrier.
*With all this talk of "A + B", 'A' is merely the magnitude of the
*carrier. The carrier is A cos(w). The average power is constant;
*the instantaneous power is not.
****

The maximum instantaneous power for a sinusoidal wave is when the peak voltage is divided by the impedance. Gosh. Since the average is constant, then the peak voltge will remain constant. Or does that change??

james

****
*Many arguments have referred to the spectrum analyzer to view the
*frequency domain. But the frequency domain requires a periodicity
*which implies a period for an average reading which is constant.
*
*This is a somewhat humorous debate. In a way, both sides are correct.
*The magnitude of the carrier frequency is constant -- but the waveform
*dips instantaneously because of cancellation by the sidebands -- but
*the sidebands wouldn't exist without varying the amplitude of the
*carrier. So which is it? Which came first, the chicken or the egg?
*They are both basically a description of the same thing.
*
*There is one difference between each side that is prolonging this
*debate: the absolute definition of carrier.
*For those looking at the time domain, it is that amplitude-varying
*signal that looks like 27 MHz. They know that, if you could count
*the cycles inside the envelope, it would be exacly 27 MHz.
*For those looking at the frequency domain, it is that center line
*exactly at 27 MHz. They know that any variations in amplitude
*create frequencies on each side of the 27 MHz which are not carriers.
*
*So, is a carrier that absolute frequency that cannot contain any
*variations in amplitude? Or is it that signal that is varied in
*amplitude to transmit information?
*
*It depends how you look at it.

I use a wilson 1000 mag mount ant. with great luck. However I do wish that I had spent a little extra and got the 5000 instead!!! Just because I am upgrading from a 500 watt amp to a Sweet Sixteen and would have a little more room there!! But all in all I am sold on the Wilson. Of course I am only a consumer and not an expert and all of this IMHO

Bill, I hope I didn't speak too soon about being able to follow you on this. I hope you can bear with me on this.

.

The mods in their easiest form are fairly straight forward. The idea is to simply bypass the output filtering in order to make the amp work over the entire 3-30 MHz range. That's just a matter of removing all but the first cap in the output filter network and providing a straight path to the TX relay. The one cap that you leave in should be re-tuned (change values or use a mica trimmer) to achieve maximum output, best stability, and best input SWR in the middle of the new operating band. When the amp is broad-banded the output load cap (the one you leave in) value won't be critical.

I think I am following. Following the output transformer is a short piece of coax going to a six turn coil of about 14 guage. On the input side of the coil is a large trimmer capacitor, going to ground.As I understand this is the one that would stay. On the output side of the coil is another short piece of coax going to the relay. At the input to the realy is a fixed capacitor to ground. This would be the capacitor that would be removed? And the coil would be by passed.Am I on the right track??

The other mod I recommend is increasing the negative feedback in order to increase stability and decrease distortion. Both amps already have negative feedback loops. Your job will be to change the part values. The feedback loops consist of a resistor, a capacitor, and sometimes an inductor connected to each power transistor collector and base. The cap is usually a .001 or .01 disk. The resistor is usually a 100 ohm, 2 watt, flameproof carbon type. The inductor (when used) is of a very low value. To increase and broad-band the feedback loops, you'll need to bypass the inductor, increase the cap value to .1 (at 25 volts or more), and reduce the resistor

value to 33 ohms.

This description matches what I am finding sans the inductor. The resistor is indeed 100 ohms and the capacitors are .01's.I think I understand this section ok.

Thanks very much for your help Bill!!
73, Bill Robertson AD6MJ

For constant audio power, the sidebands will remain at a constant power.

And yes you still get your nice pretty waveform on the o'scope

This has got to be the all-time classic comeback. This is an exact recount of National Public Radio (NPR) interview between a female broadcaster, and US Army General Reinwald who was about to sponsor a Boy Scout
Troop visiting his military installation.

FEMALE INTERVIEWER: "So, General Reinwald, what things are you going to teach these young boys when they visit your base?"

GENERAL REINWALD: 'We're going to teach them climbing, canoeing, archery, and shooting."

FEMALE INTERVIEWER: "Shooting! That's a bit irresponsible, isn't it?"

GENERAL REINWALD: "I don't see why, they'll be properly supervised on the rifle range."

FEMALE INTERVIEWER: "Don't you admit that this is a terribly dangerous activity to be teaching children?"

GENERAL REINWALD: "I don't see how, ...we will be teaching them proper rifle range discipline before they even touch a firearm."

FEMALE INTERVIEWER: "But you're equipping them to become violent killers."

GENERAL REINWALD: "Well, you're equipped to be a prostitute, but you're not one, are you?"

The radio went silent and the interview ende

If Dr. Seuss had been President Clinton's lawyer,
deposition might have read something like this:

I did not do it in a car
I did not do it in a bar
I did not do it in the dark
I did not do it in the park
I did not do it on a date
I did not ever fornicate
I did not do it at a dance
I did not do it in her pants
I did not get beyond first base
I did not do it in her face
I never did it in a bed
If you think that, you've been misled
I did not do it with a groan
I did not do it on the phone
I did not cause her dress to stain
While talking to Saddam Hussein
I did not do it with a whip
I did not fondle Linda Tripp
I never acted really silly
With volunteers like Kathleen Willey
There was one time, with Margaret Thatcher
I chased her round, but could not catch her
No kinky stuff, not on your life
I would not, could not, with my wife
Now, that Miss Flowers' tale of woes
Was paid for by my right-wing foes
And Paula Jones, and those State Troopers
Are just a bunch of party poopers
I did not ask my friends to lie
And then just hang them out to dry
I did not do it last November
And if I did, I don't remember
I did not do it in the hall
I could have, but I don't recall
There was no sex at Arlington
There was no sex on Air Force One
I might have copped a little feel
And then endeavored to conceal
But never did these things so lewd
At least not ever in the nude
These things to which I have confessed

They do not count if we stayed dressed
I never used that big cigar
You must believe me, Mr. Starr
I did not know this little sin
Would be retold on CNN
I broke some rules my mama taught me
I tried to hide, but now you've caught me
But I implore, I do beseech
Do not condemn, Do not impeach
I might have got a little tail
But never, ever did I inhale

READ IT AND WEEP PEOPLE!!!!

ORAL SEX-AN ODE TO LOVE
Penis breath, a lover's dread
Is what you get when you give head
Unpleasant as it tends to be
Be grateful that he doesn't pee
It's times like this, you wonder why
you bothered reaching for his fly
But it's too late, can't be a tease
Accept the facts, get on your knees
You know you've got a job to do
So open wide and shove it through
Lick the tip then take it all
Don't drag your teeth or he might bawl
Slide up and down, use your tongue
And feel the precum start to run
So when the fuck's he gonna cum
Just, when you can't take anymore
You hear your lover's mighty roar
And when he hits that real high note
You feel it oozing down your throat
Salty, fishy, sticky, yucky stuff
Okay, already that's enough
Let's switch you say, before you gag
And whats your revenge, your on the rag.

*******The Top Ten Men!!********

1. The Doctor because he says,"Take off your clothes"
2. The Dentist because he says,"Open Wide"
3. The hairdresser because he says,"Do you want it teased or blown"
4. The Milkman because he says,"Do you want it in front or in back?"
5. The Interior Decorator because he says,"Once you have it all in, you'll love it."
6. The Banker because he says,"If you take it out to soon, you'll lose interest"
7. The Police Officer because he says,"Spread 'em"
8. The Mailman because he always delivers his package.
9. The Pilot because he takes off fast and then slows down.
10. The Hunter because he always goes deep in the bush, shoots twice

THE CREATION OF A PUSSY

Seven wise men with knowledge so fine,
created a pussy to their design.

First was a butcher,
with smart wit,
using a knife,
he gave it a slit,
Second was a carpenter,
strong and bold,
with a hammer and chisel,
he gave it a hole,
Third was a tailor,
tall and thin,
by using red velvet,
the lined it within,
Fourth was a hunter,
short and stout,
with a piece of fox fur,
he lined it without,
Fifth was a fisherman,
nasty as hell,
threw in a fish and gave it a smell,
Sixth was a preacher,
whose name was McGee,
he touched it and blessed it,
and said it could pee,
Last was a sailor,
dirty little runt,
he sucked it and fucked it,
and called it a cunt.

GRANNY'S WAY

GRANBO: Gun-toting granny shoots 2 rapists' testicles off

MELBOURNE, Australia-Gun-toting granny Ava Estelle, 81, was so ticked-off when two thugs raped her 18-year-old granddaughter that she tracked the unsuspecting ex-cons down - - and shot their testicles off!

"The old lady spent a week hunting those bums down-and when she found them, she took revenge on them in her own special way," said admiring Melbourne police investigator Evan Delp.

"Then she took a taxi to the nearest police station, laid the gun on the sergeant's desk and told him as calm as could be: 'Those bastards will never rape anybody again, by God.'

Cops say convicted rapist and robber Davis Furth, 33, lost both his penis and his testicles when outraged Ava opened fire with a 9-mm pistol in the seedy hotel room where he and former prison cellmate Stanley Thomas, 29, were holed up.

The wrinkled avenger also blew Thomas' testicles to kingdom come, but doctors managed to save his mangled penis, police said. "The one guy, Thomas, didn't lose his manhood, but the doctor I talked to said he won't be using it the way he used to," Detective Delp told reporters. "Both men are still in pretty bad shape, but I think they're just happy to be alive after what they've been through."

The Rambo Granny swung into action August 21 after her granddaughter Debbie was carjacked and raped by two knife-wielding creeps in a section of town bordering on skid row.

"When I saw the look on my Debbie's face that night in the hospital, I decided I was going to go out and get those bastards myself 'cause I figured the police would go easy on them," recalled the retired library worker. "And I wasn't scared of them, either-because I've got me a gun and I've been shootin' it all my life." So, using a police artist's sketch of the suspects and Debbie's description of the sickos' car, tough-as-nails Ava spent seven days prowling the wino-infested neighborhood where the crime took place till she spotted the ill-fated rapists entering their flophouse hotel.

"I know it was them the minute I saw 'em, but I shot a picture of 'em anyway and took it back to Debbie and she said sure as hell, it was them," the ornery oldster recalled.

"So I went back to that hotel and found their room and knocked on the door-and the minute the big one, Furth, opened the door, I shot 'em got right square between the legs, right where it would really hurt 'em most, you know. Then I went down to the police station and turned myself in."

Now, baffled lawmen are tying to figure out how to deal with the vigilante granny. "What she did was wrong, but you can't really throw an 81-year-old woman in prison." Det. Delp said, "especially when all 3 million people in the city want to nominate her for sainthood."

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

A man is in a hotel lobby. He wants to ask the clerk a question. As he turns to go to the front desk, he accidentally bumps into a woman beside him and as he does, his elbow goes into her breast. They are both startled and he says, "Ma'am, if your heart is as soft as your breast, I know you'll forgive me." She replies, "if your penis is as hard as your elbow, I'm in room 1221."

A young man walks up and sits down at the bar."What can I get you?" the bartender inquires. "I want 6 shots of Jagermeister," responded the young man. "6 shots?!? Are you celebrating something?" "Yeah, my first blowjob." "Well, in that case, let me give you a 7th on the house." "No offence, sir. But if 6 shots won't get rid of the taste, nothing will."
****
#7
A businessman boards a flight and is lucky enough to be seated next to an absolutely gorgeous woman. They exchange brief hellos and he notices she is reading a manual about sexual statistics. He asks her about it and she replies, "This is a very interesting book about sexual statistics. It identifies that American Indians have the longest average penis and Polish men have the biggest average diameter. By the way, my name is Jill. What's yours?" He coolly replies, "Tonto Kawalski, nice to meet you."
****
#6
One night, as a couple lay down for bed, the husband gently taps his wife on the shoulder and starts rubbing her arm. The wife turns over and says: "I'm sorry honey, I've got a gynaecologist appointment tomorrow and I want to stay fresh." The husband, rejected, turns over and tries to sleep. A few minutes later, he rolls back over and taps his wife again. This time he whispers in her ear: "Do you have a dentist appointment tomorrow too?"
****
#5
Bill worked in a pickle factory. He had been employed

there for a number of years when he came home one day to confess to his wife that he had a terrible compulsion. He had an urge to stick his penis into the pickle slicer. His wife suggested that he should see a sex therapist to talk about it, but Bill indicated that he'd be too embarrassed. He vowed to overcome the compulsion on his own. One day a few weeks later, Bill came home absolutely ashen. His wife could see at once that something was seriously wrong. "What's wrong, Bill?" she asked. "Do you remember that I told you how I had this tremendous urge to put my penis into the pickle slicer?" "Oh, Bill, you didn't." "Yes, I did." "My God, Bill, what happened?" "I got fired." "No, Bill. I mean, what happened with the pickle slicer?" "Oh...she got fired too."

4

A man was visiting his wife in hospital where she has been in a coma for several years. On this visit he decides to rub her left breast instead of just talking to her. On doing this she lets out a sigh. The man runs out and tells the doctor who says this is a good sign and suggests he should try rubbing her right breast to see if there is any reaction. The man goes in and rubs her right breast and this brings a moan. From this, the doctor suggests that the man should go in and try oral sex, saying he will wait outside as it is a personal act and he doesn't want the man to be embarrassed. The man goes in then comes out about five minutes later, white as a sheet and tells the doctor his wife is dead. The doctor asks what happened to which the man replies: "She choked."

****

3

A guy walks into a bar with a pet alligator by his side. He puts the alligator up on the bar. He turns to the astonished patrons. "I'll make you a deal. I'll open this alligator's mouth and place my genitals inside. Then the gator will close his mouth for one minute. He'll then open his mouth and I'll remove my unit unscathed. In return for witnessing this spectacle, each of you will buy me a drink." The crowd murmured their approval. The man stood up on the bar, dropped his trousers, and placed his privates in the alligator's open mouth. The gator closed his mouth as the crowd gasped. After a minute, the man grabbed a beer bottle and rapped the alligator hard on the top of its head. The gator opened his mouth and the man removed his genitals unscathed as promised. The crowd cheered and the first of his free drinks were

delivered. The man stood up again and made another offer. "I'll pay anyone $100 who's willing to give it a try". A hush fell over the crowd. After a while, a hand went up in the back of the bar. A woman timidly spoke up. "I'll try, but you have to promise not to hit me on the head with the beer bottle".

A small white guy goes into an elevator, when he gets in he notices a huge black dude standing next to him. The big black dude looks down upon the small white guy and says: "7 foot tall, 350 pounds, 20 inch dick, 3 pound left ball, 3 pound right ball, Turner Brown" The small white guy faints!! The big black dude picks up the small white guy and brings him to, slapping his face and shaking him and asks the small white guy. "What's wrong?". The small white guy says; "Excuse me but what did you say?". The big black dude looks down and says "7 foot tall, 350 pounds, 20 inch dick, 3 pound left ball, 3 pound right ball, my name is Turner Brown." The small white guy says, "Thank god, I thought you said 'Turn around. '"

There was this couple who had been married for 50 years. They were sitting at the breakfast table one morning when the old gentleman said to his wife, "Just think, honey, we've been married for 50 years." "Yeah," she replied, "Just think, fifty years ago we were sitting here at this breakfast table together." "I know," the old man said, "We were probably sitting here naked as jaybirds fifty years ago." "Well," Granny snickered, "What do you say...should we get naked?" Where upon the two stripped to the buff and sat down at the table. "You know, honey," the little old lady breathlessly replied,"My nipples are as hot for you today as they were fifty years ago." "I wouldn't be surprised," replied Gramps. "One's in your coffee and the other is in your oatmeal!!!!

Well... think it's time to let this one go. I have presented several web pages and quotes that say the the carrier in an AM system does change size. Some continue to argue while others have faded into the woodwork as usual. It did truly amaze me that some (that I would have never guessed) don't seem to understand this most basic concept. Anyways... I certainly enjoyed reading this thread.

Use an antenna switch or the impedence with the 2 antennas will be wrong
and could possibly ruin your amp because of high SWR.

Gunsmoke wrote:

I am looking for a schematic/manual for a Pace 1000M 23 channel, AM/SSB CB.

I would be happy to get a-

Factory schematic/manual
Copy of the factory schematic/manual
SAMS (or equiv.) schematic/manual
A copy of a SAMS (or equiv.) schematic/manual
The SAMS packet number that contains the schematic/manual for this unit.

A source to obtain this, ie. hi-manuals for old radios. (I have delt with Ray Sarrio and he does not carry this but is excellent to deal with.)

If you are selling or require the reimburstment for copying and mailing, please let me know in advance of these cost so I may pay upfront.

Many thanks in advanced.

In my (much) younger days, I ran with a rather "vigilante" crowd of rowdies. There was a guy who was deemed "unacceptable" by the gang (he was luring young male CBers to his house to see his CB station, and then attempting to mollest them - he tried it with me, in fact). Three carloads of us went to his home late one night when we knew he was not there. His CB station was in the basement, and the feedline came out the basement window, across the grass, and up the 40 foot mast that his CLR-II antenna was mounted on. I grabbed the coaxial cable and began pulling... and pulling... and pulling... until his base station, a JCPenneys model, appeared in the window... then, I dropped it to the concrete floor... and repeated this... for about 15 minutes! During this time, the other guys were demolishing his antenna, which they'd taken down by yanking up his guy wire stakes and allowing it to crash down against the house. Once we had done about all the damage we could do, one of the guys produced a pair of dykes, cut the coax off at both ends, rolled it neatly up, and tossed it in the trunk of his car. Then, we piled in the cars and split the scene. Problem solved.

No, that is not what is being referred to.

What is being described is the fact that the carrier level dips
during the low sides of the modulation envelope and peaks on the
high sides of the envelope. That is all. And it is true.

He is looking at "the" voltage.

> This is what you see on a monitor scope - which is not frequency
> selective.

It doesn't have to be to see that the power goes to zero.

> But the scope is useless for looking at the carrier in isolation when
> there is a modulated signal as well - so any arguments using the scope
> as a basis is worthless.

Baloney. If the voltage goes to zero, there is no power. The scope
shows it all.

> Use a spectrum analyzer (which can show relative power - regardless of
> what someone claimed) and you will see that the carrier RMS (as well as
> Peak power) remain constant - with and without modulation.

In this case, the spectrum analyzer is worthless because it only
shows average power -- which is not what is being discussed.

Message-ID: <8i89n5$1h6$1@nnrp1.deja.com>
Source record: 39613

Wilson are ok! But you can't beat a 102 whip with spring! Antennas that are base loaded are your weakest for tx/rx! A five foot firestick will beat a Wilson hands down! Just because you pay more for an antenna doesnt mean it works better! When ever you put a coil in the antenna you have losses heat loss . The higher up on the antenna you can put a coil the better antenna you will have! The reason for the coil is to shorten tha antenna for a neater package for you the consumer! So you don't hit every branch in town! But for the ultimate gangbuster 1/4 whip will get out with excellent bandwidth! Hope this helps!

5841. Wilson 1000 and 5000 - Apart from the power rating whats the difference ?

Newsgroup: rec.radio.cb
Date: 2000-06-14 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <IGM15.10082$qS3.26645@tor-nn1.netcom.ca>
Source record: 39614

Apart from the obvious power rating difference, are there any other characteristics between the Wilson 1000 and 5000 antennas ? I know the Wilson 1000 has more gain (on channel 40 accdording to the advertising blurb) than the Wilson 500, but does the Wilson 5000 have anything over the 1000 ?

Thanks,

Richard.

Anybody know of a website or utility that would allow me to estimate the straight line distance between two cities ? I just want something to figure out how far I am DXing. (It's getting tedious using a map and a ruler !!)

Thanks,

Richard.

Boy, those are limited choices. If you're going to go though the bother
of mounting an antenna on your trunk, why use a short antenna that's no
better then the K-40 you're now using? The longer the better. Try a KW-7.

Oooh!

> ...that can show the mathematics that will prediuct exactly
> what will happen with 100% modualtion.

OK. Let me lay a little math on you. You can plug this into Mathcad.

Let w1 (omega 1) be the carrier frequency.
Let w2 (omega 2) be the modulation frequency.
Let A be the magnitude of the unmodulated carrier frequency.
Let B be the magnitude of the modulating frequency.

The carrier voltage looks like this:
A * cos(w1)

The modulating voltage looks like this:
1 + (B * cos(w2))

The two signals are multiplied when modulation occurs:
(A * cos(w1)) * (1 + (B * cos(w2)))

Now, you say that the magnitude of the carrier frequency does
not change. Answer this simple question:
How would you mathmatically represent a signal where the
magnitude of a frequency *did* change at a rate equal to
some other frequency?

I want to see your answer.

But, in the mean time, I'll give you my answer:
(A * cos(w1)) * (1 + (B * cos(w2)))

Hmmm. Guess what? It's the same as our modulated signal above.

OK. Let me lay a little more math on you. This may help you
frequency domain guys with your spectrum analyzers understand
where you're getting into trouble.

Let's expand the equation above. I'm going to eliminate the
"*"'s to condense the expressions a little:

(Acos(w1))(1 + (Bcos(w2)))
= (Acos(w1)) + (((Acos(w1)) * (Bcos(w2)))))

Using a trigonometric identity, we can substitute for the right terms:

= (Acos(w1)) + 1/2 (cos(w1+w2) + cos(w1-w2))
= Acos(w1) + 1/2 ABcos(w1+w2) + 1/2 ABcos(w1-w2)

So there you have it, the terms for the carrier frequency, the upper sideband and the lower sideband. Because of this expression, you folks in the frequency domain insist that, because the factor of cos(w1) is constant, the power at w1 is constant. On average, it is constant. But, keep in mind that cos(w1) term is only one of three terms. As the angle of w2 is varied, so is the power at w1. You cannot simply add the power of these three terms in the time domain. In the frequency domain, it averages out.

What if I had a 50 volt signal?
At 50 ohms, this would be 50 watts.
Then, what if I had a -50 volt signal?
At 50 ohms, this, too, would be 50 watts.

Now, what if I added those two signals?
Signal = 50 + (-50)

Do I get the sum power of those two signals?
Do I get 50 watts plus 50 watts for a total of 100 watts?
Is the 50 volts still there even though my scope shows 0 volts?

Go plug that into Mathcad.

Baloney. It is no such thing.
What you see is what you got.

> The modulation sidebands are completely independant of the carrier, which
> is why SSB works.

Well, let's see.
The frequency of the sidebands is dependent of the frequency of the
carrier.
The magnitude of the sidebands is dependent of the magnitude of the
carrier.
Hmmm. That hardly seems independent to me.

> As such, neither affects the other, once the sidebands
> have been generated.

Bill, did you ever get multi-path interference on your FM radio
when your car comes to a stop? You know - the FM radio station
cuts out; you pull your car forward 5 feet and you hear it again.
Where did the signal go? If signals don't affect each other, there
must be something wrong with your radio. You better go get it fixed.

> Unless you can grasp these simple concepts - which are covered far better
> than I can in any introductory text on RF modulation - it will be a waste
> of time to continue.

Here we go again. The old "go and read the book" response. This
is for people who don't have the answer.

Answer the question: where did the FM radio signal go?

Bill, you're losing your edge. Go answer the question in my
other post about FM multipath interference. And tell me that
is NOT real world.

> On a spectrum analyzer, the voltage will NOT stay close to zero for
> many cycles - either in the sidebands or the carrier.

On the right spectrum analyzer, it would. You need to window
the area of interest and then look at the frequency content.
Only some expensive spectrum analyzers do this. Yours doesn't
do this, Bill.

> : What if I 100% modulated my signal with a 1 Hz square wave?
> : Would I not see 1/2 second of no power followed by 1/2 second

> Forget this single cycle stuff. It is meaningless confabulation.

Sounds like you can't answer the question.

> : Would you say that there is power for the full second?
>
> Yes.

Hee hee. OK. You are saying that for the 1/2 second when no
voltage and no current emanates from my radio, there is still
power there.

> : Would you say that the carrier is there for the full second?
>
> Yes.

Bill, you need a check-up from the neck up.

>
> Only if you look at instantaneous power, which again is meaningless.

Not unless that is what you are talking about. Hmmm.

Bill, I have an electrode that peaks at 100,000 volts but the
average voltage is only 10 volts. Since that peak voltage is
meaningless, you won't mind if I probe you with it. Will you?

Jason,
Without getting into the 'which antenna is best' thing, the biggest difference between a metal antenna and a fibre-glass antenna is in the mechanics. Radiation efficiency of a metal antenna over a wire wound fibreglass antenna is negligable, unless you're talking about running lots of power. Then, the size of the wire used to make the fibre-glass antenna comes into play.
Top loaded antennas are more efficient that base loaded antennas. If you compare these two types of antennas, and assuming that both are tuned correctly, there's very little difference that you will ever hear.

Gary,
As a matter of fact, yes, I can. It does require that
you find a metal 'hardhat', maybe a WWII type helmet would
work fine. A hand-drill, a wrench or two, and pehaps an
adapter to match your hand-held's antenna jack.
While construction the antenna, you might do some isometric
exercises for your neck muscles.
'Doc

PS - In a somewhat more serious answer, a 'loaded' antenna
with a counterpoise 'might' work better than what you
have now.

Source record: 39642

Chris,
About antenna efficiency, while the top loaded antennas
are more efficient that base loaded ones, you are not going
to need 'ear protection' to handle this difference. The
difference in signal strength between a properly tuned top
and base loaded antenna probably won't be noticable by ear.
Specially on a mobile, there are so many other things that
can effect how you receive signals that raising efficiency
by going to a top loaded antenna is sort of a waste of time.
A good comparison might be the difference between a 50 watt
light bulb and a 75 watt light bulb at 100 yards. By eye,
you may not see any difference, if you measure the difference
in light by using infrared devices, you might.
If you WANT to try a different antenna, by all means do so!
Just don't expect to see/hear a huge difference in signals because of
the different 'type' of antenna.

This is USUALLY a matter of opinion. Mine is the Wilson beats the whip hands down. I've ran whips (fiberglass and steel), super penetrators, Firestick, silver loads, all kinds of mag mounts. The Wilson is my favorite. Least problems with it over all and the performance I have found in my own experiences lead me to prefer the Wilson. Mini shoot outs all the time around here on the beaches (Mini because not many that come push kilowatts) You reminded me of an interesting trial between the Wilson and a steel whip. Two Dodge Rams 1999, identical trucks and setups (both ran Galaxy 99s) with a 350 palomar in each. Radios were not peaked and purchased at same shop at same time. One had a Wilson 500....yes....no typo...a 500, the other a steel whip. I know many variables can come into play, but the Wilson 500 got over that whip every time. Even when the trucks switched antennas and boxes and mounting positions, that Wilson got over the whip. To this day that Wilson (Dee in the 'pile) can key over (not that he would) that whip (sorry, Desert Rat) every time. After hearing these 2 bicker for awhile and no matter what rat did to that whip he could not key over Dee (they're brothers) is what made me buy my first Wilson. The steel whip is a great antenna, as I said it usually comes down to personal preference. I've never been sorry I went with the Wilson. I travel often in rental cars and the Wilson is a breeze to pull off the truck and toss on the rentals. Actually, you can't really go wrong with either one. Good luck!

Maxon makes a nice telescoping antenna for $20; model WTA-1. The
Midland is an 11m/CB radio right (I'm not familiar with the model
number)? Are you going to use the radio as a handheld or how is it
going to be primarily used? Hope this helps, Omar.

wow, guess you missed the thread!

if you have a late version try this......

remove the channel selector Knob, clip the only component you see wich is a diode, power up the radio, push function, hold call for about 5 seconds radio should go into expanded frequency mode.... If not post here again, there was a couple additional steps to do on early versions of the radio... however all of them have the diode and that will need to be clipped regardles...

I seriously doubt it there is enough difference between the
two antennas to be worth the difference in price. The claim
for more 'gain' on ch-40 is pure, unadulterated B.S.!

Well i'm happy to hear that, however in over thirty years of radio and most of that working on them I've never heard it put that way! My first 300a was purchased 20+ years ago, and it still has the same set of tubes at 100%, I'm very gald skip is a smart guy, however when he said don't listen to me, he insinuated my post on tuning the amp was incorrect, wich it WAS NOT. His tune-up procedure while not incorrect is not the most efficient. Years on the newsgroup or on the radio has NOTHING to do with amount of Knowledge. As for not knowing how many Palomar 300a's are owned, anything is possible! But since i can name every one of the 300+ radios and 35 amplifiers in my collection I find it amazing. But again possible.

thanx omar and Doc, I will be using it as a homebase radio
as I am told it is quite capable with the right antenna

maybe I should have bought a homebase rig eh?

gazza

The Wilson 5000 has a much larger coil. I would recommend the 5000 over the 1000 simply for the reason if you ever upgrade your setup you know your not pushing to hard on the antenna. The 5000 also handles heat much better.

Like the other posts it is really a matter of choice and a little bit of understanding antenna theory (which I am still learning) but one of the biggest things that I have learned from this newsgroup and have tested myself, is that the more you have in the air the better your going to be. Of the antennas you have listed I have personally only used 2. K-40, and a Wilson 5000. My personal opinion...Stay away from the K-40, I never got a decent SWR out of that antenna (that could just be my setup) but I have not heard allot people that have been happy with it. I am running a Wilson 5000 and It has been an excellent antenna for me. It would have to be my recommendation.

If you're referring to a mobile OR base set-up, the quick answer is the minimum length required to reach the antenna from the radio.
Coax length (as has been discussed in lively fashion here lately) has very little to do with SWR, so you'd really have to check the antenna and the radio, and any other units (amps, etc.) which you may have in-line with your system, for shorts and bad connections.
Could you perhaps elaborate on the actual set-up and SWR readings?
Linus

Source record: 39732

I have used both the 1000 & 5000 on the same vehicle and radio/amp set up
and could not tell any difference. The 1000 actually provided a slightly
lower SWR.

BTW I am looking for a Wilson mag mount if anyone has one they want to sell.

Overpriced??? Copper?? You gotta be kidding. They were lower
than just about everyone when I bought some stuff recently. The
ONE thing you do have to watch with them is shipping & handling.
Confirm it first then order. Otherwise, they can snake you.

Bill's 2-way also has good prices and the S&H is lower.

Tom of XOR
http://xor.cc for cyber clothez that don't suck.

Washington. I have both. The Cherokee is cheaply built. Did all kinds of major stuff to it to get it the way I thought it should sound. Then again, maybe they improved the newer ones, but I doubt it. Any one seen the new Cherokees? Go to wirelessmarketing.com. They look like a Galaxy base station except they have a silver face. At least they kept the handles on it...easier to carry it to the shop.

Smart ass answers aside...the answer is no. Coppers used to send me the big catalog by mistake...hows that for switch! But all it had over the free rag was maybe one or two of those idiotic Ol Man Crapper self serving <Coppers Is Gawd> mis-spelled rants in the big part of the catalog (the back 3 pages)

They still send me the free one...but i never order from it anymore. But i still find it comes in really handy...see i found this baby Blue Jay in the yard...and every time it gets to where its constipated...i just line its cage with old Coppers Catalogs and KABOOM!!!

[Follow Ups] [Post Followup] [JTAN Discussion
Board] [FAQ]

Posted by Dan on March 28, 1999 at 01:20:43:

In Reply to: Re: message board posted by Chris on July 02, 1998 at
22:26:31:

(I couldn't believe this actually worked)I found this on a bulletin
board and decided to try it. A little while back, I was
browsing through newsgroups, and came across an article similar to this
that said you could make thousands of dollars
within weeks with only an initial investment of $6.00! So I thought,
"Yeah right, this must be a scam", but like most of
us, I was curious, so I kept reading. Anyway, it said that you send
$1.00 to each of the 6 names and address stated in the
article. You then place your own name and address in the bottom of the
list at #6,☐☐☐☐ and post the article in at least
200 newsgroups. (There are thousands) No catch, that was it. So after
thinking it over, and talking to a few people first, I
thought about trying it. I figured: "what have I got to lose except 6
stamps and $6.00 right?" Then I invested the measly
$6.00. Well GUESS WHAT!?... within 7 days, I started getting money in
the mail! I was shocked! I figured it would
end soon, but the money just kept coming in. In my first week, I made
about $25.00. By the end of the second week I
had made a total of over $1,000.00! In the third week I had over $3,000
and it's still growing. This is now my fourth
week and I have made a total of just over $8,000 and it's still coming
in rapidly. It's certainly worth $6.00, and 6 stamps, I
have spent more than that on the lottery!! Let me tell you how this
works and most importantly, WHY it works... Also,

make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage)
IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service.
You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the 4 easy steps to success: STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal. Mail the 6 envelopes to the following addresses:
#1) L.C. Wood 1909 Laurel Ln. Plano, Tx. 75074
#2) T. Schmit 2100 Date St. #1206 Honolulu, Hi. 96826
#3)K. Walker 3435 S. 173rd Street Seattle, WA 98188
#4) G. Perry GPO Box 119 Hampton 3188, Vic, Aus
#5)D. Flynn 9914 182nd Ct NE Redmond, WA 98052
#6)A. Savini RR1 Box 427K Lincoln, DE 19960

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list. STEP 3: Change anything you need to, but

try to keep this article as close to original as possible. Now,
post your amended article to at least 200
newsgroups. (I think there are close to 24,000 groups) All
you need is 200, but remember, the more you
post, the more money you make! You won't get very much
unless you post like crazy. :)This is perfectly
legal! If you have any doubts, refer to Title 18 Sec. 1302 &
1341 of the Postal lottery laws. Keep a copy of
these steps for yourself and, whenever you need money,
you can use it again, and again. PLEASE
REMEMBER that this program remains successful because of
the honesty and integrity of the participants
and by their carefully adhering to the directions. Look at it
this way. If you are of integrity, the program will
continue and the money that so many others have received
will come your way. NOTE: You may want to
retain every name and address sent to you, either on a
computer or hard copy and keep the notes people
send you. This VERIFIES that you are truly providing a
service. (Also, it might be a good idea to wrap the
$1 bill in dark paper to reduce the risk of mail theft.) So, as
each post is downloaded and the directions
carefully followed, six members will be reimbursed for their
participation as a List Developer with one dollar
each. Your name will move up the list geometrically so that
when your name reaches the #1 position you
will be receiving thousands of dollars in CASH!!! What an
opportunity for only $6.00 ($1.00 for each of the
first six people listed above) Send it now, add your own
name to the list and you're in business!
---DIRECTIONS ----- FOR HOW TO POST
TONEWSGROUPS------------ Step 1) You do not need to
re-type this entire letter to do your own posting. Simply put
your cursor at the beginning of this letter and
drag your cursor to the bottom of this document, and select
'copy' from the edit menu. This will copy the
entire letter into the computer's memory. Step 2) Open a
blank 'notepad' file and place your cursor at the top
of the blank page. From the 'edit' menu select 'paste'. This
will paste a copy of the letter into notepad so that
you can add your name to the list. Step 3) Save your new
notepad file as a .txt file. If you want to do your
postings in different settings, you'll always have this file to
go back to.Step 4) Use Netscape or Internet
explorer and try searching for various newsgroups (on-line
forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as
a new message by highlighting the text of this
letter and selecting paste from the edit menu. Fill in the
Subject, this will be the header that everyone sees as

they scroll through the list of postings in a particular group,
click the post message button. You're done with
your first one! Congratulations...THAT'S IT! All you have to
do is jump to different newsgroups and post
away, after you get the hang of it, it will take about 30
seconds for each newsgroup! **REMEMBER, THE
MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU
WILL MAKE! BUT YOU
HAVE TO POST A MINIMUM OF 200** That's it! You will
begin receiving money from around the
world within days! You may eventually want to rent a
P.O.Box due to the large amount of mail you will
receive. If you wish to stay anonymous, you can invent a
name to use, as long as the postman will deliver it.
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.
Now, each of the 5 persons who
just sent me $1.00 make the MINIMUM 200 postings, each
with my name at #5 and only 5 persons respond
to each of the original 5, that is another $25.00 for me, now
those 25 each make 200 MINIMUM posts with
my name at #4 and only 5 replies each, I will bring in an
additional $125.00! Now, those 125 persons turn
around and post the MINIMUM 200 with my name at #3 and
only receive 5 replies each, I will make an
additional $625.00! OK, now here is the fun part, each of
those 625 persons post a MINIMUM 200 letters
with my name at #2 and they each only receive 5 replies,
that just made me $3,125.00!!! Those 3,125
persons will all deliver this message to 200 newsgroups with
my name at #1 and if still 5 persons per 200
newsgroups react I will receive $15,625,00! With an original
investment of only $6.00! AMAZING! When
your name is no longer on the list, you just take the latest
posting in the newsgroups, and send out another
$6.00 to names on the list, putting your name at number 6
again. And start posting again. The thing to
remember is: do you realize that thousands of people all
over the world are joining the internet and reading
these articles everyday?, JUST LIKE YOU are now!! So, can
you afford $6.00 and see if it really works??
I think so... People have said, "what if the plan is played out
and no one sends you the money? So what!
What are the chances of that happening when there are
tons of new honest users and new honest people
who are joining the internet and newsgroups everyday and
are willing to give it a try? Estimates are at
20,000 to 50,000 new users, every day, with thousands of
those joining the actual internet. Remember, play
FAIRLY and HONESTLY and this will really work.

5924. ok Help with Mobile setup

Newsgroup: rec.radio.cb
Date: 2000-06-14 00:00:00 UTC
From: Tom Jones <tjones@netzero.net>
Message-ID: <frX15.24454$pd4.659055@news-east.usenetserver.com>
Source record: 39747

I have a Jeep Wagoneer, Ok don't laugh, I have a Mowatt 400, driving a Davemade 16 pill. problem is there is nowhere to mount a second Alternator. I know buy a suburban, would love to but can't right now. I have thought about a 180 amp OEM replacment alt. but then I am back to 12v system again. Any suggestions? Also the antenna mounting for a Mobile beam system, I am sure there are alot of smart guys out there....HELP

K-kid

The alternator you mentioned is not large enough, is the mowatt 400 a 4 pill? or does it have a driver stage? If you are interested I can show you how to do this with a mobile power supply (Motor Maul) without having to add alternators.

I agree with 'Doc. I like the idea of changing to a 3/8-24
mount since he could then use a quarterwave whip when parked
which will provide a noticeable difference when compared to
the typical base load.

Unless they've changed policy in the last 2 months, they DO have a $25 minimum order. I have also had good dealings with them. I sourced several parts from them to build my tube guitar amplifier. -Jeremy

RE: Re: Galaxy Saturn
BY: knightpatrol82@aol.com (Knight Patrol 82)

Don't know about that. I also have both the Saturn and the HR2510 and I think
the Saturn blows the 2510 away. I've made lots more contacts with the Saturn
than the 2510 both using the same antenna and the same output power.

Wrong!
A quote from their home page:
"Mouser Electronics, Inc., a distributor of electronic components, provides the maximum service to electronic buyers, regardless of the size of the customer or the size of the order. You may order by calling our toll free number, by fax, by e-mail or by our online ordering system."

As far as I know... they have never had a minimum order!

I believe that gain figures are some
what batter for the 5000. The 5000 has a
longer whip and is built like a brick
s**t house. My garage ceiling is 1 3/4
feet lower than the whip but it just
flexes OK when I drive in.
Cheers,
John

Sorry about not getting back to you so soon.
I'm running a base station to a antron99 W/ the ground plane, due to several things,
mostly anntenna placement, I have an extreamly high swr. I thought a tuner may be a quick way around this.

sw

Didn't this thread start with a question about SWR? How did it get to this point?

I don't know about all of the mathematics of it all, but I think I remember in Basic Electronics that the signal rode on the carrier by being superimposed on the carrier. First you have to have the carrier signal which is the frequency that is being broadcast, then an amplitude modulation signal is applied to the carrier but rides on the carrier wave. The carrier wave remains the same wave with modulation occurring above and below the carrier wave.

The same thing happens with FM except the frequency modulation rides on the constant frequency carrier.

Just my non scientific observation.

Coax length has NOTHING to do with SWR. It MAY or MAY NOT have a lot to do with matching the impedance of the radio to the impedance of the load. The higher the SWR the more effect the length can have.

James, run this through MathCad:
Carrier power: 4 watts
Modulating power: 100 watts
Now, how much power do you get in the sidebands?

By the way, let's go look at that equation showing the sidebands:
(A * cos(w1t)) * (1 + (B * cos(w2t))) =
Acos(w1t) + 1/2 ABcos(w1t+w2t) + 1/2 ABcos(w1t-w2t)

Since the modulating frequency is *multiplied* by the carrier
frequency to obtain the modulated signal with sidebands, the
magnitude of the carrier affects the magnitude of the sidebands.
Note the "AB" terms. 'A' is the carrier magnitude and it appears
in the sideband terms.

Another by the way, you didn't address that FM multipath
interference question. Why not?

> was 100% modulated. Thus m=1.

No, "100% modulation" was your statement. The formulas are good
for all levels of modulation. It is determined by the 'A' and
'B' terms.

If you must have a modulation index term, simply substitute "m * A"
for 'B'.

> One thing that I seem to miss out of your math is the reference to time.
> Since the general equation for AM is a function of
> time.

You are correct. All the "w" terms should be "wt". I've been
correcting these in my posts. He left those out.

> I guess t=1 in your case.

No. 't' is a variable. It is the time. It goes from 0 to infinity.

f(t) doesn't change the magnitude of any frequency in your equation.
Since it is added, it merely changes the offset. Something needs to
be multiplied by that "A*cos()" term to change its magnitude.

> ***************************
> *But, in the mean time, I'll give you my answer:

> *
> *Hmmm. Guess what? It's the same as our modulated signal above.
> *
> *****************************
>
> maybe you should go back and look at the math again.

I've looked. It is impeccable (except for the missing 't's you
pointed out). Let's take another look at it (with the 't's
properly inserted):
(A * cos(w1t)) * (1 + (B * cos(w2t)))

cos(w1t) is the carrier frequency

Now, let's rearrange the terms to create an equivalent equation
for the modulated signal:

= (A + (AB * cos(w2t))) * cos(w1t)

Once again, recall that the unmodulated carrier is shown in the form:
A * cos(w1t)
where 'A' is the magnitude of the carrier frequency.

Now, look at the equation for the modulated signal:
'A' has been replaced by:
(A + (AB * cos(w2t)))

This magnitude term is now varying at the w2 frequency (the
modulating frequency).

Why don't you use Mathcad to plot this function?

> can't just be added together?

't' is the time variable.
Sure, you can plug in values for t and solve for the voltage at that
point in time. You can compute and add the terms. No problem.

What you can't do is add the power in the time domain. That's
what the following example illustrates.

> ****************************
> *What if I had a 50 volt signal?
> *At 50 ohms, this would be 50 watts.
> *Then, what if I had a -50 volt signal?

> *Is the 50 volts still there even though my scope shows 0 volts?
> **********************
>
> In most schools of mathematics 50 + -50 = 0

So, you agree that these two signals (each of which, when
isolated, corresponds to non-zero power), combine to produce a signal
of zero power.

Then, why do you believe that the power at w1 is determined
solely by the first term of this equation:
Acos(w1t) + 1/2 ABcos(w1t+w2t) + 1/2 ABcos(w1t-w2t)

> I now have a few tiny questions.
>
> 1)If the carrier is zero at 100% modulation, then what is the value of the
> carrier at 50% modulation?

I wouldn't say the carrier "is zero" at 100% modulation. It dips to
zero momentarily. At 50% modulation, it dips to half magnitude.

> 2)If you look at the modulation envelope the vally is not zero. Thus that
> implies that the total power is not zero. Then does that mean there is
> some carier value?

Yes. If the valley does not go to zero, there is a non-zero carrier
value.

> 3) then how can there be a carrier value present with less than 100 %
> modulation, m < 1, in the general equation for AM?

> and m is defined as
>
> the peak DSB-SC amplitude divided by the peak carrier amplitude.

>
> and DSB-SC is the Double Sideband Suppress Carrier signal, ie the peak
> sideband amplitude divided by the peak carrier.

Easy. It is provided by the first term "A*cos(w1*t)".
As m decreases, there is less of a cancelling effect by the
second term: "m*A*cos(w2*t)*cos(w1*t)"

Let me use that 50/50 example as an analogy.
Let's change it to:
50 + (m * (-50))

If m is 1, I get zero.
As I decrease m, the net voltage goes up.

> which leads me to my final questions:
>
> 4) if the time averaged value of the carrier is changing with modulation
> then should the peak value remain the same over the same period of time?

The time averaged value of the carrier does not change with modulation.
The average power is constant. That's what everybody is seeing on
their spectrum analyzers.

> 5) If the peak value were to be equal to zero how can the modualtion
> index be 1 at 100% modulation?

peak = A + (m * A) = (1 + m) * A

So, you're saying:
(1 + m) * A = 0
and
m = 1

It works out fine if A is zero.

There is a solution to this strange question but, in real world terms,
it is meaningless. It is 100% modulation at zero watts.

> 6) isn't division by zero undefined?

Yes. But who is dividing by zero?
And why are you changing the subject?

> james

A friend of mine had the Smokin Gunn 2 element beam, and it worked pretty well. It's a very small antenna without much wind drag, and for the money, they work well. Personally, I like how they are constructed, using aluminum box tubing for the boom. It makes for a sturdy antenna. If I'm not mistaken, you can also buy extra elemets and the additional boom to make it a 3 or 4 element beam later on if you wish. I'm not sure if that applies to the 2 element beams, but I think for the 3 element beam you can do this. Gizmotchy beams also allow for expansion like this. I know several people who have run them (a friend of mine has a 9 element Gizmotchy that was once a 5 element). PDLII beams also perform quite well, and have excellent rejection and duability. I've known people to have PDLII's up for 20 yyears or so without trouble. Not bad duability for a beam under $250. Another advantage to all the antennas I mentioned is that they are all dual polarity (vertical/horizontal). The M104 is usually one or the other, unless you have the M104 HV setup.

You may not believe it but I do try to get to the truth.

Early in this thread it was stated that the amplitude of
the carrier never changes with modulation. I disagreed
and said something to the effect "the influence of the
carrier remains constant, but it, in its self, does not."

I believe the difference between your way of thinking
and my way of thinking has more to do with you using a
broad definition of the word amplitude.
You would say the "amplitude of the carrier" never changes
and I would choose to qualify it by saying 'the influence of it"
never changes. I also tried to further define what I meant by
saying, "It, in itself" does not stay constant when talking about
a carrier in the resultant wave.

Whether or not you are following me so far I don't know, but
let me give you a example that better describes what I am
talking about.

Take a carrier of 27mhz and 100% mod it with 1khz.
The resultant will contain :
1 watt upper at 27.001
1 watt lower at 26.999
4 watt carrier
Now feed this into a signal splitter so that we have two
equal signals of half power. We will call them signal A and B
We need two signals for a mixing process.

We now want to take signal B and with a very selective
filter remove the carrier component of it. We are left with
a double sideband signal. Next let's reverse the phase of this
double sideband signal. It is now time to mix signal A with
signal B. We end up with the opposite phase sidebands

canceling out and have a continuous four watt carrier

The above fits with my qualifier of "the influence of the carrier never changes" It also fits with your "the amplitude of the carrier never changes" If you use a broader definition of the term "carrier amplitude.within a resultant wave".

I however said one other thing in trying to explain my "take" on just what I was talking about. I additionally said "the carrier in itself" does not stay constant.. If looking at the resultant signal itself and not the broader procedure of re-acquiring the carrier as per the example above then it fits also.

So I don't really think we are of opposing viewpoints of what is happening. Rather we are defining what is happening with different qualifiers.

Hello I have a brand new base plate and felt cover along with the complete amplifier board with header connector new for Astatic Night and Silver Eagle TGU9 bases has roger beep ect switches on board complete ready to plugin in base with 9v battery connection and all.

Replace your worn out board and PTT switch ect all in one shot with this or make a amplified from a stock D104.

50.00 shipped prepaid US postal MO will be shipped USPS priority.

Please reply only to e-mail address below as I do not always watch NG for replies.

Thanks for reading...sk

To say that coax length does not always matter is wrong. It does not effect SWR but it does effect the match between source and load. This is why you occasionally see a setup where the greatest field strength does not occur with minimum SWR. SWR on short runs of low loss cable is not as important as matching impedance of the source to load. Fortunately for us the average SWR meter does this a lot better than measuring SWR. Unfortunately confusing impedance matching with SWR is the source of a lot of arguments and misconceptions.

5978. Uniden Pocket Max and Rechargeables

Newsgroup: rec.radio.cb
Date: 2000-06-15 00:00:00 UTC
From: nsnfwhite@one.net.au
Message-ID: <3948bf8a.47545142@news.one.net.au>
Source record: 39690

I have two Uniden Pocket Max UHF CBs Model UH045XR

I am having a lot of trouble using them with standard NiCd Rechargeables, which they claim to be OK with.

I have tried the Aust Uniden Agent (useless) and the store (in the process of dealing with the problem, but not looking good...starting to dismiss me and use "big words" in the hope I will go away <G>) The store has said their radios work OK, and give good transmit times with standard NiCds.

My radios show low battery after a very short time, and even though I consider the battery voltage to be q uite reasonable. I have charged the batteries for a full 24 hours on a trickle charger, and tried different chargers and batteries

I won't post details here yet, as that are complex.

Does anyone have
(a) experience with these radios and rechargeables, either good or bad
(b) knoweldge about NiCds and their peculiarities, and patience enough to try to sort this out.

I understand Voltage, Series resistance, In Circuit Voltage measurement, currewnt drain etc, (just by way of indicating my understanding of electric circuits. I will at least be able to understand ideas, and ask the right questions.)

Any offers of help will be greatly appreciated.

>but it does effect the match between source and load.

I thought I was only talking about SWR, not even mentioning impedance matching. Apparently I just worded it poorly? Length has nothing to do with SWR... but if you want to get into impedance matching, it does have an impact and what you're saying is true, that much I do know... I just wasn't talking about that aspect of it.

Or use headphones for the talkback speaker output. Then you won't get the feed back,
unless you really crank the volumes up. If the squeal you get is from RF and not the
talkback speaker, then you need to evaluate your ground points and also may need to
install some RF bypass capacitors in the power mic or audio preamp circuit.
What also can cause RF feedback squeal is a high antenna SWR. So check that and
take measures to lower your SWR if it is high.

Bill.

5984. RCI 2950 variable output power : SSB

Newsgroup: rec.radio.cb
Date: 2000-06-15 00:00:00 UTC
From: Darren <darren@wragg.org.uk>
Message-ID: <8ibkotlaq1@uranium.btinternet.com>
Source record: 39696

Here's one for you 'Ranger' experts.

Brand new CRT (french badged model) RCI 2950. Variable output on front of radio only
adjusts AM/FM power.

This is pathetic and not at all what I expected.

I plugged in an RF power meter and found where to set the radio to get 2-3 watts output to drive a linear. Job done.... NO.....use SSB and you're still pumping the full SSB output (25w ish perhaps). Result : 2 sets of MRF455s fried in the linear. Good job I've just tried the SSB on a meter before paying out for some more pricey trannies.

Is the RF adjustment on the front meant to work in this way? I didn't want to go and play around inside the radio at all...it's not 'the done thing' with brand new radios.

Is there any way (simply) to make the RF control also control SSB output or is it screwdriver and schematic time?? I can turn the SSB power down permanently, but it still wont be variable like am/fm. I dont want to knock the mic gain down to do the same as this will screw my already average audio and be a nuisance when i switch back to FM.

Any ideas?

~
Darren

Yep, the lid is welded shut - and you are on the WRONG side of it. 50 watts will 100% modulate a 100 watt carrier. 25 watts in the upper sideband, 25 watts in the lower sideband, 100 watts in the carrier. All of the components do NOT lie at the same frequency (or in phase) so, guess what? The sum of all of the components will hit zero at times - but the CARRIER is always there. The total sum of carrier and sidebands changes. Your algebra is not exact, but there is a BIG difference between algebra and algebra in motion. If the carrier simply changed amplitude, you could listen to a conversation with a 100 Hz filter. It WON'T work. You need about 6 KHz for AM. Get rid of one sideband and the carrier and you can use a 3 KHz filter.

The carrier doesn't change! You are looking at the sum of the carrier AND the sidebands to see the change on the o-scope, wattmeter, voltmeter, or whatever.

To the people who DO understand, forget it. You won't convince these guys.

5988. Looking for info on a Dak mark X

I'm thinking about buying a broken Dak mark X radio. It's supposed to have a hole in the circuit board, but it worked before the hole was there. I was searching through past postings in this group at Deja.com, and there seems to be some debate over what kind of board was in it. From what I've seen it has either a Uniden board, like what's in a Cobra 142gtl, a board like a Cobra 148gtl, or a Cybernet SSB board. If it's a cybernet board, is it the single board, like what's in a Lafayette Telsat SSB-140 or the wierd double board that's in the GE Superbase? I was figuring that if the radio is beyond hope of repair, then I could always get a radio that has the same board and swap them out. Also, where do the tubes in a Dak come into play? They're the transmit tubes right? Where in the RF circuit do they replace transistors? Is it before or after the driver (probably a 2sc1306 or 2sc2166)? Any info is very welcome. Thanks!

PS, what's something like this worth broken? It's in very nice physical shape, but it has 2 switches added to the face, probably for extra channels I'd guess. I'm debating on whether it's worth buying or not.

Thanks gadget.
I am waiting to get the rig to see which version it is and what condition it is in. Hope you are right that the older one is better. I believe I am getting the older version.

Bill.

the swing modification is easier in the new one that the old one. All
you have to do with a new one is volt the final, and change 1 resistor.
The old one you can do the same with, but there is a way to volt it
using modulator volts, and get super audio out of it. That probably
sounds like gibberish, especially ecause I'm not so great at
explanations, but it can be done. I'm going to work on a description of
it, and maybe I'll build myself a web page with all those goodies on
it.

You are already way off track and out of context. The 50 volts was not
for modulation.
It was merely one component of a signal in the same way that
1/2 ABcos(w1t+w2t) is the upper sideband component and
1/2 ABcos(w1t-w2t) is the lower sideband component which is
added to the Acos(w1t) component.

>...but the CARRIER is always there.

Let's go back and look at the waveform:
(A * cos(w1t)) * (1 + (B * cos(w2t)))

The carrier is:
(A * cos(w1t))
and is being multiplied by a term that goes through zero.
OK, basic math here: what is zero times any number?

> Your algebra is not exact...

That's funny that you can say the algebra is wrong but cannot say
where it is wrong. Did you consider that maybe it isn't wrong?

He's laid his cards on the table. They are now subject to the full
scrutiny of everybody. They look pretty solid to me. Where's your
case? That's all you can say? It's "not exact"?

> ...but there is a BIG difference between algebra and algebra in motion.

Translation: you can't find the algebra to back your claim.

> If the carrier simply changed amplitude, you could listen to a
> conversation with a 100 Hz filter. It WON'T work.

No one has denied that changing the carrier amplitude creates sidebands.
In fact, the math even showed that it does! They are there.
The sidebands are an integral part of the signal. Remove the sidebands
and all you have is a carrier that does not vary in amplitude. In
other words, you must remove the changing carrier amplitude to
remove the sidebands. Get it?

> To the people who DO understand, forget it. You won't convince these
> guys.

>
> 73s, Jim AA2QA / PG-GB-05180

It doesn't take an amateur or commercial license to deride some simple algebra without being able back your claim. The math is all there. You said it's "not exact." Now, show us where.

>**************************

As i said, This ONE RF waveform still crosses the zero volt line at
the carriers time period. This same signal will vary in amplitude.
This same signal varies in frequency.

I know you're having trouble figuring out how the two things below
happen at the same time.

1. crosses the zero volt line at the carriers time period
2. varies in frequency*

* HINT..... I did not define what type of frequency variation.

And if you can't figure it out then TO BAD!!!!

little more easier to show and tell.

****
*> ...that can show the mathematics that will prediuct exactly
*> what will happen with 100% modualtion.
*
*OK. Let me lay a little math on you. You can plug this into Mathcad.
*
*Let w1 (omega 1) be the carrier frequency.
*Let w2 (omega 2) be the modulation frequency.
*Let A be the magnitude of the unmodulated carrier frequency.
*Let B be the magnitude of the modulating frequency.
*
*The carrier voltage looks like this:
*A * cos(w1)
*
*The modulating voltage looks like this:
*1 + (B * cos(w2))
*
*The two signals are multiplied when modulation occurs:
*(A * cos(w1)) * (1 + (B * cos(w2)))
*
****

Thanks. You have confirmed that you now can write the general equation for an
amplitude modulated signal. Now the most interesting part is do you understand
it?

I at least know why you did not include the modulation index into the equation
because you prefaced that with that statement that the signal was 100%
modulated. Thus m=1. One thing that I seem tomiss out of your math is the
reference to time. Since the general equation for AM is a function of time. I
gues t=1 in your case.

****
*Now, you say that the magnitude of the carrier frequency does
*not change. Answer this simple question:
*How would you mathmatically represent a signal where the
*magnitude of a frequency *did* change at a rate equal to
*some other frequency?
*
*I want to see your answer.
****

simple

y(t)= [f(t)+(A*cos(w1*t))]+(A*cos(w1*t)*cos(w2*t))

wher f(t) is any function that will vary the amplitude at any rate that you
should desire. One nice method would be to make f(t) proportional to cos(w2*t)
and thus when the audio is low so is the carrier. When ausio peaks so will the
carrier reach a maximum. This would give the so called "swing" feature.

****
*But, in the mean time, I'll give you my answer:
*(A * cos(w1)) * (1 + (B * cos(w2)))
*
*Hmmm. Guess what? It's the same as our modulated signal above.
*
****

maybe you should go back and look at the math again.

****
*OK. Let me lay a little more math on you. This may help you
*frequency domain guys with your spectrum analyzers understand
*where you're getting into trouble.
*
*Let's expand the equation above. I'm going to eliminate the
""'s to condense the expressions a little:
*
*(Acos(w1))(1 + (Bcos(w2)))
*= (Acos(w1)) + (((Acos(w1)) * (Bcos(w2)))))
*
*Using a trigonometric identity, we can substitute for the right terms:
*
*= (Acos(w1)) + 1/2 (cos(w1+w2) + cos(w1-w2))
*= Acos(w1) + 1/2 ABcos(w1+w2) + 1/2 ABcos(w1-w2)
*
*So there you have it, the terms for the carrier frequency, the
*upper sideband and the lower sideband. Because of this expression,
*you folks in the frequency domain insist that, because the factor
*of cos(w1) is constant, the power at w1 is constant. On average, it
*is constant. But, keep in mind that cos(w1) term is only one of three
*terms. As the angle of w2 is varied, so is the power at w1. You cannot
*simply add the power of these three terms in the time domain. In the
*frequency domain, it averages out.

****

No you can't. But you can plug a value of t in and solve the cosines. The rest are nothing more than scalar values. Once the cosines are solved then you are dealing with scalar values. I don't see any reason why those can't just be added together?

****
*What if I had a 50 volt signal?
*At 50 ohms, this would be 50 watts.
*Then, what if I had a -50 volt signal?
*At 50 ohms, this, too, would be 50 watts.
*Now, what if I added those two signals?
*Signal = 50 + (-50)
*
*Do I get the sum power of those two signals?
*Do I get 50 watts plus 50 watts for a total of 100 watts?
*Is the 50 volts still there even though my scope shows 0 volts?
****

In most schools of mathematics 50 + -50 = 0

*Go plug that into Mathcad.

I now have a few tiny questions.

1)If the carrier is zero at 100% modulation, then what isthe value of the carrier at 50% modulation?

2)If you look at the modulation envelope the vally is not zero. Thus that implies that the total power is not zero. Then does that mean there is some carier value?

3) then how can there be a carrier value present with less than 100 % modulation, m < 1, in the general equation for AM?

remember the general equation is:

y(t)= A*cos(w1*t)+ m*A*cos(w2*t)*cos(w1*t)

where m is th modualtion index

and m is defined as

the peak DSB-SC amplitude divided by the peak carrier amplitude.

and DSB-SC is the Double Sideband Suppress Carrier signal, ie the peak sideband amplitude divided by the peak carrier.

which leads me to my final questions:

4) if the time averaged value of the carrier is changing with modulation then should the peak value remain the same over the same period of time?

5) If the peak value were to be equal to zero how can the modualtion index be 1 at 100% modulation?

6) isn't division by zero undefined?

102" whip or a Wilson 1000. I ran a 102" fiberglass whip on the rear bumper of my Beetle, and it worked well. I switched to a mag mount Wilso 1000 on the roof, and noticed no difference. Wilson's work well, but a 102" whip will out talk it, and they're really cheap too. $14.95 at Rat Shack

*Audio power isn't constant but it can have a constant average power.
*It can be constant in the sense that periods repeat but it is
*not, at the lowest level, constant.
*
*Sound familiar? ;-)
****

Probably better stated is the time averaged audio power is constant. That does not imply a DC value. Thus the sideband power will remain steady as long as the time averaged power of the audio remains steady.

K40 trunk mounts are not so bad. Usually you can get good SWR with
them, but the performance is not as good as a Wison 1000 or 5000. It's
probably comparable to a Wilson 500. I do know that K40's are real
particular about thier coax too. Once it's been cut, even when coupled
together, it never seems to tune up correctly again. The only solution
is to replace the wiring harness, but for $20 to $25 it's awful
expensive. Another great benifit of the Wilsons. The coax is super easy
to change.
A properly tuned 102" whip will give very comparable performance to a
Wilson 1000, but usually due to mounting location (bumper, trunk lid)
they tend to be directional. A magnet mount is easy to stick in the
center of the vehicle for omnidirectional operation

6022. ?10 metre Antenna Mounting?

Newsgroup: rec.radio.cb
Date: 2000-06-15 00:00:00 UTC
From: mmkc@my-deja.com
Message-ID: <8iaanq$ht3$1@nnrp1.deja.com>
Source record: 39795
Cross-posted to: rec.radio.amateur.antenna,rec.radio.cb,sci.geo.satellite-nav,alt.dss

hello,
I am currently hooked up to microwave internet, the technician installed an antenna on my roof. Later we discovered that we're not receiving much of a signal, probably due to the antenna not being raised high enough to reach over some trees and a small hill. It probably needs to get up to around 10 metres above my roof in order to reach over the hill, trees etc., right now it's around 4-5 metres above the roof. How much would a 10m roof-top pole, tower or whatever, cost?

thank you

Sent via Deja.com http://www.deja.com/
Before you buy.

You might try running a variable power control from the SSB power adjusment in the radio to the external part and adjust it as needed.
Hope this helps...

it should control SSB as wll as AM/SSB, the only time i've seen them not have variable power on SSB is when someone removes AMC transistor wich is TR32 i believe..... if your radio was supposedly new in box, no mods i think you may have gotten your leg pulled, but perhaps the French version is different??? also 25 watts should'nt fry 455's on SSB, not for short test periods anyhow....

You will find that trash always side with trash.

There is a guy here in the Central California area who throws deadkeys pretty much every day.

This unfortunate person is disabled and living on State handouts...which i think bothers him quite a bit. Don't get me wrong, there is absolutely nothing wrong with disability income if the person receiving it is really disabled. But from what i have heard him say on the radio this guy is faking it and feels guilty about it but does not have the honesty or morals that would allow him to admit that to the state. And so he tries to make innocent people who have not provoked him in any way pay for his shame and misery by keying up on them. Though he will never know himself well enough to know those unpleasent facts about himself , and so will never be in a position to stop himself from resorting to these childish cowardly games.

Listening to this poor soul try to generate and then sustain his self esteem is one of the most pathetic situations you could ever imagine.

He has keyed up on me at least 30 times in the last several weeks. Mostly because i won't talk to him. He even keys up on this blind guy who is out on the radio. He did that 6 or 8 times in just the last 4 days alone...he will even key up on people that he is conversing with.

Here is the best part, to some radios in town his dead carrier looks just like mine...even though i never throw a dead carrier on people, and only throw a dead carrier when i am checking my SWR's or power, and never ever when people are talking.

So this mutt has figuired out that our carriers look identical...and knows that because i am considered much more of a class person than he is, and so he resents me anyway...that he can get revenge on me by throwing dead carriers on everyone and that they will think it is me doing it though it is not.

The competent decent radio operators in town know it is not me...but all the trash think it is.

Its kind of funny...and also really sad. If you are a straight arrow...and conduct yourself on the radio with a decent amount of class, the scumbags on the radio will instantly hate you...and try to dig up dirt on you that does not exist...so they can lower you down to their inferior level. At least in their twisted minds.

The point is that you will encounter these sorts on the radio everywhere...and they are like cockroaches and will never go away. So,

you will have to put up with them or get off the radio.
Oh yea...this low brow mutts handle who keys up on everyone is called
Wally Gator.

Rock On.

How to turn $6 into $50,000!-Or more!!-It 100% works!!!
READING THIS COULD CHANGE YOUR LIFE:

This really does work if you give it a honest try!

I found this on a bulletin board and decided to try it. A little while back, I was
browsing through newsgroups, and came across an article similar to this that said you
could make thousands of dollars within weeks with only an initial investment of $6.00!
So I though, "Yeah right, this must be a scam", but like most of us, I was curious, so I
kept reading. Anyway, it said that you send $1.00 to each of the 6 names and
addresses stated in the article. Then you take off the #1 name and move everyone up
the list. You then place your own name and address in the bottom of the list at #6,
and post the article in at least 200 newsgroups. (There are thousands) No catch, that
was it. So after thinking it over, and talking to a few people first, I thought about
trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?" Then I
invested the measly $6.00.
Well GUESS WHAT!!... Within 7 days, I started getting money in the mail! I was
shocked! I figured it would end soon, but the money just kept coming in. In my first
week, I made about $25.00. By the end of the second week I had made a total of over
$1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now
my fourth week and I have made a total of just over $42,000.00 and it's still coming in
rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the
lottery!! Let me tell you how this works and most importantly, why it works… Also,
make sure you print a copy of this article NOW, so you can get the information off of it
as you need it.

I promise you that if you follow the directions exactly, that you will start making more

money than you thought possible by doing some-thing so easy!

Suggestion: Read this entire message carefully! (print it out or download it.) Follow
the simple directions and watch the money come in! It's easy. It's legal. And, your
investment is only $6.00 (Plus postage)

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is
virtually no risk - it really works!!!! If all of the following instructions are adhered to,
you will receive extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to
60 days. This program remains successful because of the honesty and integrity of the
participants. Please continue its success by carefully adhering to the instructions.
You will now become part of the Mail Order business. In this business your product is
not solid and tangible, it's a service. You are in the business of developing Mailing
Lists. Many large
corporations are happy to pay big bucks for quality lists. However, the money made
from the mailing lists is secondary to the income which is made from people like you
and me asking to be included in that list. Here are the 4 easy steps to success:
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper
"PLEASE PUT ME ON YOUR MAILING LIST. "Now get 6 US $1.00 bills and place
ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the
envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and
seal them, MAKE SURE THAT THERE ARE ENOUGH STAMPS ON YOUR
ENVELOPES. You should now have 6 sealed envelops, each with a piece of paper
stating the above phrase, your name and address, and a $1.00 bill. What are you doing
is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate
service and you are paying for it! Like most of us I was a little skeptical and a little
worried about the legal aspects of it all. So I checked it out with the US Post Office
(1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to

the following addresses:

#1) Joseph S. Matuszczak - 15 Chickasaw Ct., Palm Coast, FL 32137
#2) Mary Ann Veres - 6190 Meadow Lakes Drive, East Amherst, NY 14051
#3) J.Ware - 811 Palmer Road, Bronxville, NY 10708
#4) Kristina Hamme - RD 7 Box 7685, Spring Grove, PA 17362
#5) Jonas Hodum - 219 Nashville blvd, Spring Grove, PA 17362
#6) Marc Buxton III - 3809 Breckridge Circle, Florence, SC 29505

STEP 2: Now take the #1 name off the list that you see above, move the other names
up (6 becomes 5, 5 becomes 4, etc…) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups or emails, (I think there are close to 50,000 groups) All you need is 200, but remember, the more you post, the more money you make!

**EVERYBODY AROUND THE WORLD CAN DO IT, BUT REMEMBER TO PUT
ENOUGH STAMPS ON YOUR ENVELOPES!!!!!**
This is perfectly legal! If you have any doubts, refer to Title 18 sec. 1302 -&- 1341 of
the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you
need money, you can use it again, and again.
PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions.
Look at it this way. If you are of integrity, the program will continue and the money
that so many others have received will come your way.
NOTE: You may want to retain very name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the
directions carefully followed, six members will be reimbursed for their participation as
a List Developer with one dollar
each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollar is CASH!!! What an
opportunity for only $6.00 ($1.00 for each of the first six people listed above.) Send it
now, add your own name to the list and you're in business!

---DIRECTIONS--------FOR HOW TO POST TO NEWSGROUPS--------------
Step 1) You do not need to re-type this entire letter to do your own posting. Simply
put your cursor at the beginning of this letter and drag your cursor to the bottom of

this document, and select 'copy' from the edit menu. This will copy the entire letter
into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of the blank page.
From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so
that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do your postings in
different settings, you'll always have this file to go back to.
Step 4) Use Netscape or Internet explorer and try searching for various newsgroups
(online forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the
Subject, this will be the header that everyone sees as they scroll through the list of
postings in a particular group, click the post message button. You're done with your
first one! Congratulations… THAT'S IT! All you have to do is jump to different
newsgroups and post away, after
you get the hang of it, it will take about 30 seconds for each newsgroup!
**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU
WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**
That's it! You will begin receiving money from around the world within days! You
may eventually want to rent a P.O. Box due to the large amounts of mail you will
receive.

------------------------------Now the WHY
part-----------------------------------
Out of 200 postings, say I receive only 5 replies (a very low example). So then I
made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5
and only 5 persons respond to each of the original 5, that is another $25.00 for
me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $625.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!!! Those 3,125 persons will
all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will

receive $15,625.00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the Internet and
reading these articles everyday?, JUST LIKE YOU are now!!
So, can you afford $6.00 and see if it really works?? I think so …

Remember, play FAIRLY and HONESTLY and this will really work.
GOOD LUCK!!!!!!!!!!!!

A.T.

*> *
*> **********
*>
*> Thanks. You have confirmed that you now can write the general equation
*> for an amplitude modulated signal.
*
*Then you agree.
****

I agree that the instantaineous power of the composite waveform will equal zero
at a given point in time that is periodic based on the frequency of the
modulating signal. I also agree that the composite waveform is what one sees on
an o'scope.

****
*
*> I at least know why you did not include the modulation index into the

*> equation because you prefaced that with that statement that the signal
*> was 100% modulated. Thus m=1.
*
*No, "100% modulation" was your statement. The formulas are good
*for all levels of modulation. It is determined by the 'A' and
*'B' terms.
*
*If you must have a modulation index term, simply substitute "m * A"
*for 'B'.
*
*> One thing that I seem to miss out of your math is the reference to time.
*> Since the general equation for AM is a function of
*> time.
*
*You are correct. All the "w" terms should be "wt". I've been
*correcting these in my posts. He left those out.
*
*> I guess t=1 in your case.
*
*No. 't' is a variable. It is the time. It goes from 0 to infinity.
****

I know it is variable. Since he did not include it in his equation, I took it
that he set the value to 1

****
*> ************************
*> *Now, you say that the magnitude of the carrier frequency does
*> *not change. Answer this simple question:
*> *How would you mathmatically represent a signal where the
*> *magnitude of a frequency *did* change at a rate equal to
*> *some other frequency?
*> *
*> *I want to see your answer.
*> ************************
*>
*> simple
*>
*> y(t)= [f(t)+(A*cos(w1*t))]+(A*cos(w1*t)*cos(w2*t))
*>
*> wher f(t) is any function that will vary the amplitude at any rate that
*> you should desire. One nice method would be to make f(t) proportional
*> to cos(w2*t) and thus when the audio is low so is the carrier. When
*> ausio peaks so will the carrier reach a maximum. This would give the so
*> called "swing" feature.
*
*f(t) doesn't change the magnitude of any frequency in your equation.
*Since it is added, it merely changes the offset. Something needs to
*be multiplied by that "A*cos()" term to change its magnitude.
****

Correct, the term f(t) should have been multiplied to cos(w1*t)*A. The intent was not to give an exact example but was to show the point that the carrier term., which is what I call it, can have it's amplitude changed by introducing another function. The other poster felt that no function could be introduced to change the amplitude of the first term,(a*cos(w1*t)).

```
******************************
*> ***************************
*> *But, in the mean time, I'll give you my answer:
*> *(A * cos(w1)) * (1 + (B * cos(w2)))
*> *
*> *Hmmm. Guess what? It's the same as our modulated signal above.
*> *
*> ******************************
*>
*> maybe you should go back and look at the math again.
*
*I've looked. It is impeccable (except for the missing 't's you
*pointed out). Let's take another look at it (with the 't's
*properly inserted):
*(A * cos(w1t)) * (1 + (B * cos(w2t)))
*
*cos(w1t) is the carrier frequency
*
*Now, let's rearrange the terms to create an equivalent equation
*for the modulated signal:
*= (A + (AB * cos(w2t))) * cos(w1t)
*
*Once again, recall that the unmodulated carrier is shown in the form:
*A * cos(w1t)
*where 'A' is the magnitude of the carrier frequency.
*
*Now, look at the equation for the modulated signal:
*'A' has been replaced by:
*(A + (AB * cos(w2t)))
*
*This magnitude term is now varying at the w2 frequency (the
*modulating frequency).
*
*Why don't you use Mathcad to plot this function?
******************************
```

I did to check my math and it does give a the audio waveform at twice the amplitude. Thanks

```
**************************
*
*> ***************************
*> *OK. Let me lay a little more math on you. This may help you
*> *frequency domain guys with your spectrum analyzers understand
*> *where you're getting into trouble.
*> *
```

*> *Let's expand the equation above. I'm going to eliminate the
*> *"*"'s to condense the expressions a little:
*> *
*> *(Acos(w1))(1 + (Bcos(w2)))
*> *= (Acos(w1)) + (((Acos(w1)) * (Bcos(w2)))))
*> *
*> *Using a trigonometric identity, we can substitute for the right terms:
*> *
*> *= (Acos(w1)) + 1/2 (cos(w1+w2) + cos(w1-w2))
*> *= Acos(w1) + 1/2 ABcos(w1+w2) + 1/2 ABcos(w1-w2)
*> *
*> *So there you have it, the terms for the carrier frequency, the
*> *upper sideband and the lower sideband. Because of this expression,
*> *you folks in the frequency domain insist that, because the factor
*> *of cos(w1) is constant, the power at w1 is constant. On average, it
*> *is constant. But, keep in mind that cos(w1) term is only one of three
*> *terms. As the angle of w2 is varied, so is the power at w1. You cannot
*> *simply add the power of these three terms in the time domain. In the
*> *frequency domain, it averages out.
*> ************************************
*>
*> No you can't.
*
*You can't...?
****

agreed you can't add power of two frequencies directly in the time domain.

****
*> But you can plug a value of t in and solve the cosines. The
*> rest are nothing more than scalar values. Once the cosines are solved
*> then you are dealing with scalar values. I don't see any reason why those
*> can't just be added together?
*
*'t' is the time variable.
*Sure, you can plug in values for t and solve for the voltage at that
*point in time. You can compute and add the terms. No problem.
*What you can't do is add the power in the time domain. That's
*what the following example illustrates.
*
*> ******************************
*> *What if I had a 50 volt signal?
*> *At 50 ohms, this would be 50 watts.
*> *Then, what if I had a -50 volt signal?
*> *At 50 ohms, this, too, would be 50 watts.
*> *Now, what if I added those two signals?
*> *Signal = 50 + (-50)
*> *
*> *Do I get the sum power of those two signals?
*> *Do I get 50 watts plus 50 watts for a total of 100 watts?
*> *Is the 50 volts still there even though my scope shows 0 volts?

*> **********
*>
*> In most schools of mathematics 50 + -50 = 0
*
*So, you agree that these two signals (each of which, when
*isolated, corresponds to non-zero power), combine to produce a signal
*of zero power.
****

Yes I did back Tuesday in a post. I said yes at a given time the instantaineous value of the composite waveform is zero. That occurs when the cos(w2*t) is equal to -1. If i remember my trig, this should occur at 3*PI/2 radians or every 270 degrees of the modulating frequency. Still I have yet to see evidence that the A*cos(w1*t) term is changing amplitude from influence of the audio frequency. I don't see the multiplier to change it's magnitude.

This is the term that I have been trying state that remain constant in the modulation process. Most books that I have read call this the carrier term.

Looking at the equation again;

A*cos(w1*t) + A*m*cos(w1*t)*cos(w2*t)

The only way this equation can equal zero is when cos(w1*t) equals zero or when cos(w2*t) equals -1. If A is scalar value and it not varying with time then it can't be zero. If it were then the whole equation would be zero for all t. If m =0 then the carrier term is present, A*cos(w1*t) for all t. Which it should with no modulation. It is the cos(w1*t) term that varies with time and establishes frequency, not A. A establishes the magnitude. I guess one could have a freqwuency of zero magnitude. I not shure how useful that is.

****
*Then, why do you believe that the power at w1 is determined
*solely by the first term of this equation:
*Acos(w1t) + 1/2 ABcos(w1t+w2t) + 1/2 ABcos(w1t-w2t)
****

Because the text book that I used calls the carrier term A*cos(w1*t). The term (1+m*cos(w2*t) is the DSB-SC term, which is the term that generates the sidebands. The product of the two terms is the composite wavform known as DSB-LC. Taking the product and some trig substitution leaves the three terms a*cos(w1*t)+ 1/2*A*m*cos(w1*t+w2*t) + 1/2*A*m*cos(w1*t-w2*t). The second and third are not the carrier. The only variation to the first term due to the cosine fuctin of w1. Time averaging the first term over 2n*PI periods will yield A. While the second and third terms contain w1, they are not w1. Instead terms two and three are a shifted above and below w1 by w2. The second and third terms are analogous to mixing products. Take w2 as a fixed sinusoid, the results of terms two and three will be distinct frequencies above and below the carrier. Each having their own spectra whose power is varying at the rate of w2. Now if w2 produces two distinct frequencies and we cannot directly add the power in th e sidebands and the carrier cannot be directly added in the time domian we are stuck with a unique situation. Now could what we see on an o'scope be a discrete

time solution of each terms cosine and then added together to yield a single value to be displayed over what appears to be continuos trace? No matter how it does it, the o'scope has solved the power addition problem.

****
*
*> I now have a few tiny questions.
*>
*> 1)If the carrier is zero at 100% modulation, then what is the value of the
*> carrier at 50% modulation?
*
*I wouldn't say the carrier "is zero" at 100% modulation. It dips to
*zero momentarily. At 50% modulation, it dips to half magnitude.
****

Could the reason the composite waveform seen on the scope be a result of the carrier power + or - the phase of the modulation power? Thus when (m*cos(w2*t)) equal -1 at some point in time, then the modulation function (1+m*cos(w2*t))is multiplied by the carrier will be zero.

****
*> 2)If you look at the modulation envelope the vally is not zero. Thus that
*> implies that the total power is not zero. Then does that mean there is
*> some carier value?
*
*Yes. If the valley does not go to zero, there is a non-zero carrier
*value.
****

I argue that it is not the carrier but the composite signal that is zero.

****
*> 3) then how can there be a carrier value present with less than 100 %
*> modulation, m < 1, in the general equation for AM?
*>
*> remember the general equation is:
*>
*> y(t)= A*cos(w1*t)+ m*A*cos(w2*t)*cos(w1*t)
*>
*> where m is th modualtion index
*>
*> and m is defined as
*>
*> the peak DSB-SC amplitude divided by the peak carrier amplitude.
*>
*> and DSB-SC is the Double Sideband Suppress Carrier signal, ie the peak
*> sideband amplitude divided by the peak carrier.
*
*Easy. It is provided by the first term "A*cos(w1*t)".
*As m decreases, there is less of a cancelling effect by the
*second term: "m*A*cos(w2*t)*cos(w1*t)"
****

Yes but is the first term changing? That has been my whole arguement. It does
not. The first term is the carrier.

****
*Let me use that 50/50 example as an analogy.
*Let's change it to:
*50 + (m * (-50))
*
*If m is 1, I get zero.
*As I decrease m, the net voltage goes up.
*
*
*> which leads me to my final questions:
*>
*> 4) if the time averaged value of the carrier is changing with modulation
*> then should the peak value remain the same over the same period of time?
*
*The time averaged value of the carrier does not change with modulation.
*The average power is constant. That's what everybody is seeing on
*their spectrum analyzers.
****
*> 5) If the peak value were to be equal to zero how can the modualtion
*> index be 1 at 100% modulation?
*
*peak = A + (m * A) = (1 + m) * A
*
*So, you're saying:
*(1 + m) * A = 0
*and
*m = 1
*
*It works out fine if A is zero.
****

I have always seen this equation, (1+m)*A, as the maximum of the composite
waveform, ie the maximum of the envelope and not the carrier. I have always seen
m defined in terms of the peak sideband amplitude divied by the peak carrier
amplitude. If the peak carrier amplitude is changing at the same rate as the
peak sideband amplitude and in iverse proportion, you can get the peak sideband
amplitude divided by zero. That is what led to question #6.

james

****
*There is a solution to this strange question but, in real world terms,
*it is meaningless. It is 100% modulation at zero watts.
*
*> 6) isn't division by zero undefined?
*
*Yes. But who is dividing by zero?
*And why are you changing the subject?
*

*> james

The amp will work exactly the same with or without them. as well as on the 4 port combiner
the resistors have no affect on performance And I am sure it was built by 425 if you look
inside, he is not the neatest builder and always liked to make his own changes without daves approval ....

It is a voice chip built into the radio, where guys record there voice
yelling 11111, or worldwide or whatever they want
it is used at keydowns so guys dont have to yell in the mic all day.
Typically if Dave makes it people are scared
of it, so they dont allow it.

I've found the best thing to do is simply unplug your antenna(s) and place the ends outside (some folks like to place the ends in a glass jar)...
It's a good idea to have lightning protectors on your gear, to stop indirect-strike surges and help sometimes with noise suppression (a claim of some) but there's no protection from damage due to a direct hit, whether you have a good ground system/LP or not. Best bet is to unhook and wait fort he storm to pass.

Technically true, but there's a helluva lot more interesting people on the
internet than on amateur radio, not to mention that it's faster.

...and I don't have to worry about QRM or QRN on the internet either.

Ground fault interupters and grounded coax switches are good IF you have a good path for current to follow should you take a hit. No device can offer total protection from a direct hit but you can minimize damage. Ground your mast or tower with copper strap.Strap is preferred over wire because it carries a lower inductance. If you use wire, make sure it is at least 10 AWG. A solid copper rod 8 foot long will do wonders as a ground rod. Solid copper costs more, but you can get it. Most rods are copper coated and result in lower conductivity. Use strong clamps or an exothermic weld to connect the wire or strap to the base of your tower or mast and run the shortest distance to the ground. Keep the run straight as possible and the rod should not protrude more than 18 inches above earth. Surge protectors and static discharge devices are available and ratings vary. Thats a start.

Ron,
Go down to your library and look at the National Electrical Codes book for radio grounding. They recomend grounding to the same place as the telephone, electrical power lines etc, ground to. You might also look at what they recomend for radio and antenna ground systems. Those are the people who ought to know.
As most everyone else has said, there is no protection for a direct lightning strike, or for a very near one. Don't be 'suckered' by the 'gap' type lightning arresters, they are less than useless. By the time a 'spark' has jumped the gap, your radio is already junk.

Ham,
No one said that length never makes a difference. It does in
certain cases, as you said.
The problem with SWR is that impedance matching does affect it,
and since impedance matching is difficult with out some means of
measuring impedance (easily/cheaply), most people don't. You can
'fudge' an impedance match by adjusting antenna length. That's
sure not the best way of doing it, but that's how most matching
is done. In cases where you have 'fudged' the impedance matching,
the length of the feed line can be manupulated to make things
'look' right. That's where those 'magic' numbers for coax come in.
It's a lousy way of doing things, but it's easier than doing it
right...

It is not the same with or without them, the guy was having a problem with it smoking the 100 ohm resistors on the port, when I added the balancing resistors to the input combiners it stopped, you are right it does not need them to perform. But if there is a small imbalance between any of the 4 pill sections it will cause your main combiner (splitter) to smoke, even a small imbalance, had these been in there it would take more of an imbalance to cause the 100 ohms on the splitter to fail. To me if you balance each stage perfectly you should never even warm even a 1/2 watt 50 ohm resistor if put in there place, just my 2 cents.

You're partially correct. There were probably other
factors involved, but the 25 input watts was definitely
one of the factors.

Whether or not a pair of 455s can handle 25 watts depends on a
number of variables. The original author is in England and may
be using a poorly designed Italian amp.

If an amp is unstable enough, it can pop power transistors like
popcorn even at seemingly okay drive levels. No input swamping,
no feedback, no base resistance, and inadequate cooling are all
reasons for premature and repeated transistor failure that he
could be experiencing.

I sent him a detailed message via e-mail outlining a variety
of possible solutions. If necessary, I'll continue to help
him based on his response.

The original author said the radio was stock and that messing
with it isn't something that is immediately done where he
is. Here's that part of his message:

> Is the RF adjustment on the front meant to work in this way? I didn't
want
> to go and play around inside the radio at all...it's not 'the done thing'

Shall we clear up another misconception here.......Dave did not invent the voice chip in a radio for one......the chip and board are readily available to anyone who wants one just as antennas, boxes, coax,leece nevilles,regulators and radios. The people who cry about the chip, or as some named it "repeater", need to stop their cryin' and start their buyin'. it isnt just the chip that gets you a win at a break. You could get the same if not more gain in audio if you were to use a digital sound processor inline with your microphone. The main element to winning is your antenna system. And then all the rest falls into place.

Dont go to Amidon... they are a rip...

Go straight to the SOURCE... Fair-Rite makes the ferrites for Amidon..

Part number FT50B-61 are for the input transformers and
Part number FT82-61 are for the output transformers

Find the brass piping at your nearest hobby shop.. I grab them straight from
K&S engineering in Chicago, IL
Stock # 139 for the 1/2" round brass tubing for the output transformers
I dont have any small brass tubing for the input transformers.. I only got
52 of them made up.. <g>

In case anyone is wondering how or why.. and I will be more than glad to
admit this.. I build the box called "Dave Clone" plain and simple... why try
to fit another name on it as if it were my design... Have fun...

Hey -Boo- I got some pics for ya then also...

OH.. BTW, these are Amidon part numbers.. just a helluva lot easier to remember than Fair-Rite's part numbers.. their numbers are like 6100080 etc, etc, etc.. they will know what you are talking about though if you give them the Amidon numbers.. Its also common to get a couple broken up ferrites... though thats why they have always shipped extra in each package...

$250 for an old 820? That's all it is worth. Perhaps more than it is worth. Should have sold it ten years ago.

I'm selling ASTEC:
VS3-K0-K2-K3-00
Single Phase 85-264 VAC / 47-440Hz Input
Three slots for output:
Slot one 2v @ 150amps
Slot two 5v @ 150amps
Slot three 12v @ 62.5 amps

Detailed Specifications On Power Supply:
http://www.astec.com/products/1150.astec.pdf
(Must have Adobe Acrobat installed to view)

Page 3 of 6 shows chart to determine all watt
and amperage outputs as well as the number
of slots for each unit.

This page has other models for sale:
http://www.newark.com/
Search for "manufacturer" part number and enter "VS3"
for other models then use the PDF (Adobe) specification
chart to compare output watts / amps.

One example is a VS3-C6-C6-20
which is VS3 or 5x8x11 case
Slot one is "C6" which is 28v @ 32.1amps
Slot two is "C6" which is 28v @ 32.1amps
The unit on that page is about $2,000

One other model:
VS3-D2-C2-20 is:
5x8x11 case
Slot one: 2v @ 240amps
Slot two: 2v @ 180amps
Price: $2,129

Selling these for $200 UPS "Shipped".
No lower on the price

Inquires via email only. Do not post to the newsgroup.

Thank you

There is nothing wrong with triming the coax to get a good impedance match as long as you know what you are doing. This is especially true when you are using a solidstate amp when you cannot count on the input or output impedance to be the magic 50. Like I said though SWR meters don't measure SWR they are much better at indicating impedance match. One thing I have not figured yet, Does the output impedance of a transmitter effect SWR reading? I know it does not effect the actual SWR. Another way to pose the question would be," when you use an SWR bridge to indicate impedance match is the indicated match between load and source or between load and 50 ohms.

Not sure about the your use of these things, but Ni-Cds have a memory effect.
If you do not drain them completely before charging them, they turn into junk.
Not completely discharging them before charging shortens the power delivery
time.
I suggest you try Ni-Mh batteries. They have no memory effect and can be
charged/discharged at whatever interval you are comfortable with.

Except that it is a pain in the butt and in real world scenarios
(i.e. where coax losses are non-zero), even at its best, it does
not perform as well as a matched system where the SWR is lower.

Longer lengths of coax contribute to more loss.
A higher SWR (even in a matched system) contributes to more loss.

If you "know what you are doing," you can reduce your SWR and
minimize your coax length for the optimal, highest performing
solution. Why make your goal a compromised solution? ...especially
if you "know what you are doing?"

> This is especially true when you are using a solidstate amp when you
> cannot count on the input or output impedance to be the magic 50.

You would be better off matching your output to the 50 ohm input
of a low SWR line. Then, you don't get the extra losses due to
SWR and you could cut your coax shorter for even lower losses.

Cutting the coax to specific lengths is a joke of a solution.
The first problem is that, if your transmitter impedance is not 50 ohms,
you probably don't know what it is.
Secondly, even if you did know its impedance, modifying the coax
length only provides certain impedances. It may get you closer to a
match but it almost certainly will not provide that conjugate impedance
you need for a total match; you will still need an antenna matcher or
output tuning to get all the way to a match. If you must do this, you
may as well just tune your output for 50 ohms.

> Like I said though SWR meters don't measure SWR they are much
> better at indicating impedance match.

You did say this before and I still don't know what it means.

> One thing I have not figured yet,
> Does the output impedance of a transmitter effect SWR reading?

No.

> I know it does not effect the actual SWR. Another way to pose the
> question would be," when you use an SWR bridge to indicate impedance
> match is the indicated match between load and source or between load

> and 50 ohms.

SWR meters are generally constructed for one characeristic impedance. They must do this by virtue of the way they work. They sample both voltage and current to provide a directional reading. For a forward only reading, the sampled reverse voltage and reverse current must cancel each other out. In order for these signals to cancel out of the reading, there must be a fixed relationship between the two (the impedance). At any other characteristic impeance, the ratios between these two parameters would be different and the cancelling mechanism would not work completely.

Have to agree with that Dave! Reply made me laugh guess my sense of humour is warped....anyway I saw one setup that I thought was neat. The guy had made a copper strip with female coax connections on it. A copper grounding braid was attached to it and went outside to a 8' foot copper rod in the ground. So his habit was that whenever a storm came over uplug radios and ground them.

nope, not mistaken. I saw on a mod site that the newest ones need to have the diode clipped. It makes sense to me. The FCC found out that it was so simple to mod the early versions and told RF Limited to redo the radio thus coming out with the newest ones where you have to go inside to mod it.

Message-ID: <8idqv5$32a$1@nnrp1.deja.com>
Source record: 39900

Hi, all;
I need a good variable power mod for my Cherokee 1000 base radio. It currently dead keys 5 and swings to 15 on a.m., and goes to about 25 on ssb. I would like to be able to dial down the deadkey on a.m. to about 1 watt and swing from there. I am driving an amp that uses a 6LB6 driver and 5-6LQ6's for the finals. Any info is appreciated.
Thanks. "Gunslinger" Phoenix, AZ

Source record: 39903

Cheers everyone fopr your ideas. I've got a friend with radio fixing expertise coming to check that the modulation tranny is in there and if not he'll install one. I was hoping to leave the radio unmodified.
Perhaps the french CRT model has this mod as standard. Whatever the outcome, with the information you've all provide, I think I'll get it sorted, even if I need to manually replace the variable power control with my own method of limiting the current/voltage to the final.

Incidentally, the linears ARE cheap italian jobbies. Zetagi B300p. In England we only run low power compared to you American guys with your kilowatts etc.

Thanks once again, particularly Bill for his very detailed informative email.

73s.

thanks for the info but I was looking for the part # for the larger ferrite bead that strings on a wire and taps the output transformer to feeds the collectors voltage. I have been using the small little # 64 beads that barley
slide over a piece of wire, I would like to use a large ferrite so I can just wrap it through the core and call it a day.

thanks again for your help.

I think I would start investigationg this by checking the coax connectors and make certain that there are no shorts, that they are moisture-free, and they have continuity from end to end. By seeing the change by just moving the coax a bit, it certainly sounds like something fishey is going on with it. If it is old, might consider replacing with some good quality coax and see how things go.

Bill,
Sounds like your meter is behaiving 'normally'. If you
put any meter in a high RF field, readings can change. By
the watt meter staying the same, I'd suspect nothing wrong
with the system, your just over-loading the meter. As a test,
move the meter a few feet from the radio, see what happens.
'Doc

hillbillydave,
I worked as a firefighter for 20 years. In that time
I saw one lightning strike to a non-commercial radio that
did enough damage to cause a fire to the structure. But
then again, anything is possible, and who wants to take the
chance??
'Doc
PS - When that 'end' of the coax in that pickle jar starts
snapping, it's creating an electrical field. If it's
strong enough, it'll get your radio too.

6138. Re: How to protect CB radio from lighting?

Barry,
Thats probably the next best thing to disconnecting
'outside'. Just remember, use BIG cables to ground! There's
a bunch of electricity to get rid of in a lightning bolt,
and braid, small wire, etc, just "ain't" gonna cut it!
Big ground cables are good...little ones are asking for it.

* **********
*
* Correct, the term f(t) should have been multiplied to cos(w1*t)*A.

I started to write a response to this but I can't make heads or tails
out of your equation. Where the heck did w2 come from? You have
frequencies coming out of nowhere. f(t) is the modulating function
but w2 appears out of the blue.

Let me rephrase the simple question:
How would you mathmatically represent a signal where the
magnitude frequency w1 *did* change at a rate equal to
frequency w2?

Hello everyone,
These probably sound a little foolish, but I'm just starting out and would like some more information :

1) If I can hear someone's signal, but they can't hear mine, it's probably because their anteanna is higher or they have more watts, correct?

2) say I went to Radio Shack and bought a ham transceiver without a license. If anyone found out that I was broadcasting w/o a license, what could they possibley do? how would they find out who I was? (sorry that's off topic)

3) What's a whip and dipole anteanna?

4) What is SWR?

5) What would be the expected range of a 4-watt handheld with like a 6" anteanna?

6) (this kindof has to do with my limited understanding of SWR) say I found out my anteanna wasn't working very well (bad swr). what coud I do to fix it?

7) I can't use a TV anteanna for a CB, could I? (I have this huge TV antenna that I'd like to mount in our atic and use on my CB, but I'm not sure I can do that).

8) why can't I just use RG-59 (CATV coax) to connect my anteanna to my CB? What's the difference between RG-59's 75-ohm to RG-6's 50-ohm?

Thanks,

--

Hamm4fun wrote:
First, an SWR meter does measure SWR. It does this by
measureing then comparing forward voltage and reverse voltages.
The relation between these two voltages is defined as SWR or
VSWR if you want to be picky.
There IS something wrong in trimming coax to get a good
impedance match, Except, in cetain cases which do not apply
to most antenna systems. If you change the 'electrical' length
of coax between the radio and the amplifier to obtain an acceptable
impedance match between the two, while it will work, it just
means that the amplifier is incorrectly designed (assuming that
the radio and coax are both the same impedance).
What ever is on the "input" side of the SWR meter is what
the SWR meter compares what ever is on the "output" side of
the SWR meter, 'to'. The input impedance is the reference which
the rest of the system is compared to. This comparison determines
the SWR of the system. So yes the transmitter output impedance
can certainly affect SWR.
An SWR meter does NOT measure impedances. It does indicate
the relationship between impedances by measureing voltages on
the feed line. You have to know the impedance of the device on
the input side of the meter to 'guess' what the impedance of
the device on the output side is. Unless there is a 'goof' in
manufacturing a commercially made radio, you can assume it's
output is at 50 ohms impedance. It never is exactly, but it's
close enough not to matter.
An SWR meter doesn't know 50 ohms from 26 ohms, or 75 ohms, or
a 1000 ohms. If you have 26 ohms impedance on the input side,
and 26 ohms on the output side, the meter reads 1.0:1, or the
relationship between the two impedances. If you have 50 ohms
on the input, and 25 ohms on the output, you get a 2:1 SWR. The
same SWR if you have 50 ohms on the input and 100 ohms on the
output side of the meter.

By the way, here's another simple question.
Does this function not vary the amplitude of cos(w1t)?

Is the amplitude of 1 * A * cos(w1t) the same as:
...2 * A * cos(w1t)?
...1.5 * A * cos(w1t)?
...0.5 * A * cos(w1t)?
...0 * A * cos(w1t)?

The value of the right hand term above, (1 + (B * cos(w2t))),
varies from "1 - B" to "1 + B".
If 'B' were 1, that term would pass through all values from 0 to 2.

> *
> *No. 't' is a variable. It is the time. It goes from 0 to infinity.

Yes. It doesn't even have to start at 0. The time is arbitrary.

> took it that he set the value to 1

No. Don't set 't' to 1 unless you want to evaluate the voltage at
t=1. That doesn't do anything for us or this discussion.

Buckaroo,

Please don't take this wrong or anything--I am not posting it to be a smart aleck---BUT, if you EVER get a direct hit that follows your coax into that jar, if you are in the same room and SURVIVE the results, you'll never put a coax into a glass jar again. The results CAN be a jar that EXPLODES into a thousand pieces flying all over the room im-bedding themselves in the furniture, the walls and whoever happens to be in the room, too. You see, I know of one case where this happened, killing one adult and one 8 yr old child. About the only way to protect against lightning is to disconnect the antennas, throw the coax ends out the window and unplug everything. Even that is no guarantee.

Respectfully,

Jerry

What's the difference between 50 and 75 ohm? is there a way to change that? Like, a TV antenna really isn't anything but a bunch of metal rods welded together, so why won't it work with a CB? What makes it 75 ohm? Is it the metal used?

snip
>1) If I can hear someone's signal, but they can't hear mine, it's
>probably because their anteanna is higher or they have more watts,
>correct?

Should only be because the are using more wattage, or they have a
interfering noise close to them. The antennas are reciprocal devices.
If they transmit well they will receive just as well.

>2) say I went to Radio Shack and bought a ham transceiver without a
>license. If anyone found out that I was broadcasting w/o a license, what
>could they possibley do? how would they find out who I was? (sorry
>that's off topic)

Transmitting where? Ham bands or modify the radio for CB? I would only
do the latter and keep your mouth shut.

>3) What's a whip and dipole anteanna?

A whip is a 102" stainless steel mobile antenna. A dipole is a base
antenna with two elements about 17 feet long in total. One element is
hooked to the shield and one to the center conductor. This is
sometimes also referred to as a half wave antenna. Electrically a
dipole, a half wave, and a 1/4 wave ground plane are very
similar in performance.
>
>4) What is SWR?

Standing Wave Ratio It represents the impedance (resistance) match
between the radio and the antenna. If you radio was 50 ohms and the
antenna was 100 ohms then a swr meter hooked into the coax would
measure a ratio of 2:1 The closer the ratio (1:1) the better chance
for a full transfer of power.

>5) What would be the expected range of a 4-watt handheld with like a 6"
>anteanna?

? Not far One mile?

>6) (this kindof has to do with my limited understanding of SWR) say I
>found out my anteanna wasn't working very well (bad swr). what coud I do
>to fix it?

Increase or decrease its length is the normal way.

>7) I can't use a TV anteanna for a CB, could I? (I have this huge TV
>antenna that I'd like to mount in our atic and use on my CB, but I'm not
>sure I can do that).

You must use a antenna that is resonant to the CB frequencies. TV is not the same frequency so it would not be resonant.

>8) why can't I just use RG-59 (CATV coax) to connect my anteanna to my
>CB? What's the difference between RG-59's 75-ohm to RG-6's 50-ohm?
>
>Thanks,

It's not that you can't use it, but using the incorrect impedance coax will transform impedances. Most likely to your disadvantage. Stick with 50 ohm coax.

> or when cos(w2*t) equals -1.

Let me verify by rewriting the equation:
A*cos(w1*t) * (1 + m*cos(w2*t))

You are basically right. This equals zero when:
A = 0, or (trivial answer we don't care about)
cos(w1*t)=0, or (trivial answer we don't care about)
m*cos(w2*t)=-1 (term we are really interested in)

We can let m=1 to get what you got:
cos(w2*t)=-1

> If A is scalar value and it not varying with time then it can't be
> zero. If it were then the whole equation would be zero for all t.

Yes, the first trivial answer.

> If m=0 then the carrier term is present, A*cos(w1*t) for all t. Which
> it should with no modulation.

Yes, the second trivial answer.

> It is the cos(w1*t) term that varies with time and establishes
> frequency, not A. A establishes the magnitude. I guess one could
> have a freqwuency of zero magnitude. I not shure how useful that is.

OK so far but you've ignored the third and most important condition:
cos(w2*t)=-1

This is the condition that drives the carrier to zero. This is
what creates that valley in the waveform. And this is exactly
what we are talking about.

It happens every cycle of the modulating frequency.
If the modulating frequency were 1000 Hz, this condition would
happen 1000 times per second.

You're getting very warm.
BTW, I don't mean to be nit-picky but it happens every 360 degrees
of the modulating frequency *at* 270 degrees.

> Still I have yet to see evidence that the A*cos(w1*t) term is changing
> amplitude from influence of the audio frequency. I don't see the
> multiplier to change it's magnitude.

You're not watching. Let me do it again:

Unmodulated carrier:
A * cos(w1t)

Modulated carrier:
(A * (1 + (Bcos(w2t)))) * cos(w1t)

There is nothing up my sleeve.

You've already agreed that the lefthand term goes to zero every
time the modulating frequency passes through 270 degrees.
Thus, the whole term goes to zero.

And let me address this "composite waveform" thing one more time.

If I have two terms:
50 + (-50)

Is the first 50 still there even though I see zero?
When I see zero, how do I know that it is not really 40 + (-40)?
...or 30 + (-30)?

...or 5000 + (-5000)?

And, just like my FM multipath interference question (which nobody answered by the way), if I stop at a red light and my FM radio station cuts out, is the signal really still there? Why am I not receiving a signal if it is there? The "composite waveform" shows nothing but you say it is there. What's wrong with my radio?

** *
** *f(t) doesn't change the magnitude of any frequency in your equation.
** *Since it is added, it merely changes the offset. Something needs to
** *be multiplied by that "A*cos()" term to change its magnitude.
** ***************************
**
** Correct, the term f(t) should have been multiplied to cos(w1*t)*A.
*
*I started to write a response to this but I can't make heads or tails
*out of your equation. Where the heck did w2 come from? You have
*frequencies coming out of nowhere. f(t) is the modulating function
*but w2 appears out of the blue.
*

*Let me rephrase the simple question:
*How would you mathmatically represent a signal where the
*magnitude frequency w1 *did* change at a rate equal to
*frequency w2?
****
go back and reread your own post and you will see where I got w2. As for the above equation, I just added a fuinction to the A*cos(w1*t) term. Instead I should have multiplied f(t) to A*cos(w1*t). Then the equation would look like this:

y(t)= [f(t)*(A*cos(w1*t))]+(A*cos(w1*t)*cos(w2*t))

If you can't make sense of it then plug any fucntion into f(t) and solve the equation. It will show you that the amplitude of the carrier term of the composite DSB-LC siganl can be altered but not from modualtion.

*>
*> The only way this equation can equal zero is when cos(w1*t) equals zero
*> or when cos(w2*t) equals -1.
*
*Let me verify by rewriting the equation:
*A*cos(w1*t) * (1 + m*cos(w2*t))
*
*You are basically right. This equals zero when:
*A = 0, or (trivial answer we don't care about)
*cos(w1*t)=0, or (trivial answer we don't care about)
*m*cos(w2*t)=-1 (term we are really interested in)
*
*We can let m=1 to get what you got:
*cos(w2*t)=-1
*
*> If A is scalar value and it not varying with time then it can't be
*> zero. If it were then the whole equation would be zero for all t.
*
*Yes, the first trivial answer.
*
*> If m=0 then the carrier term is present, A*cos(w1*t) for all t. Which
*> it should with no modulation.
*
*Yes, the second trivial answer.
*
*> It is the cos(w1*t) term that varies with time and establishes
*> frequency, not A. A establishes the magnitude. I guess one could
*> have a freqwuency of zero magnitude. I not shure how useful that is.
*
*OK so far but you've ignored the third and most important condition:
*cos(w2*t)=-1
****

No I have stated before that this condition is when the composite waveform is
zero. The composite waveform is the result of modulation and contains trhree
components. The carrier is only but one.

****
*This is the condition that drives the carrier to zero. This is
*what creates that valley in the waveform. And this is exactly
*what we are talking about.
****

No it drives the composite waveform to zero. w2 is not the carrier it is the modulation frequency.

****
*It happens every cycle of the modulating frequency.
*If the modulating frequency were 1000 Hz, this condition would
*happen 1000 times per second.
****

In one second the composite waveform will be sero for 1000 times if the w2 is 1000 Hz.

*> *> *(A * cos(w1t)) * (1 + (B * cos(w2t)))
*
*By the way, here's another simple question.
*Does this function not vary the amplitude of cos(w1t)?
*
*Is the amplitude of 1 * A * cos(w1t) the same as:
*...2 * A * cos(w1t)?
*...1.5 * A * cos(w1t)?
*...0.5 * A * cos(w1t)?
*...0 * A * cos(w1t)?
****

In the framewaork of the above example yes the amplitude of cos(w1*t) is
changing by some variable time a scalar quantity.

****
*The value of the right hand term above, (1 + (B * cos(w2t))),
*varies from "1 - B" to "1 + B".
*If 'B' were 1, that term would pass through all values from 0 to 2.
****

If the term B is 1 then the result is 0 to 2 yes.

so now what is your point. You have mapped out the upper portiuon of the
composite waveform. Good for you.

: yet now. Will reground. Shall reground mike also?

I think I saw the first part of your post... Your having a squeal or feedback problem with your D104 or another mic on your radio. If you haven't got any of that echo/feedback crap in circuit, your problem can be sourced this way.

Place the radio into a termination (dummy load). Did the squeal go away..? If so, replace your coax with something better... say RG-214. If the squeal is still in place with the power mic only, you need to knock down some of the mics open loop gain path... most often done with resistor in the right location.

Try the termination first, Email if you want the resistor fix...

Mr. Baggums,
It's called STALLING. Herbie has no confidence whatsoever in his frivilous garbage being heard by the S.C. All he's doing is hoping and praying for a Bush victory in November and with it a revamping of the S.C. along with the F.C.C.

Although being a staunch Herbie hater lo these many years, I must give credit where credit is due and difficult as it is to admit, so far the felon has made monkeys out of the F.C.C. Let's see now-when did he start lying to Judge Luton-I think it was in 1994. Can you believe that the guy's still on the air with a call removed from the FCC database when Moses parted the Red Sea and Jesus walked on water?

God, the guy has used every type of appeal short of a banana-has essentially tied up the Feds in a mass of paperwork and has cost the taxpaying citizenry probably a million bucks or more. It's called due process while some of us refer to it as a "doo doo process."

And from what I hear, whenever he does make an appearance on 14.313, it's the same old bullsnot he's been pulling forever. Attacks on Intercon, Ruth Hoffman, AF2Y, WB2OTK and other sterling ops while Riley Hollingsworth sits there quietly never citing him for agitating which he decries and about which he writes threatening letters. Why not you ask? Because if he pops FZ, IT'S APPEAL TIME LADIES AND GENTLEMAN and the saga continues.

: causing my antenna to be directional?

Yes, and you should feed each antenna with a 75 ohm line from the center
connecion. Two horizontal dipoles will give you a nice skywave antenna
(high angle of radiation), the angle depends on their distance above
ground. The length of the phasing harness depends on the frequency and
type of coax used.

*
*You're getting very warm.
*BTW, I don't mean to be nit-picky but it happens every 360 degrees
*of the modulating frequency *at* 270 degrees.
*
*> Still I have yet to see evidence that the A*cos(w1*t) term is changing
*> amplitude from influence of the audio frequency. I don't see the
*> multiplier to change it's magnitude.
*
*You're not watching. Let me do it again:
*
*Unmodulated carrier:
* A * cos(w1t)
*
*Modulated carrier:
*(A * (1 + (Bcos(w2t)))) * cos(w1t)
*
*There is nothing up my sleeve.
*
*You've already agreed that the lefthand term goes to zero every
*time the modulating frequency passes through 270 degrees.
*Thus, the whole term goes to zero.
*
*

*And let me address this "composite waveform" thing one more time.
*
*If I have two terms:
*50 + (-50)
****

The problem is that you fail to realize that the -50 watts power is split into two sidebands. Their frequency is shifted from the carrier by w2 up or down. How do you propose to add the powers in the time domain? If you imply that the total power of the composite signal goes to zero then, yes I agree to that. The problem is the carrier being amplitude modulated is not the a*cos(w1*t) term. Instead the sideband carrier terms are amplitude modulated. They are a function of the central carrier w1, the modulating frequency w2 amd the power level of both.

james
****

*Is the first 50 still there even though I see zero?
*When I see zero, how do I know that it is not really 40 + (-40)?
*...or 30 + (-30)?
*...or 5000 + (-5000)?
*
*And, just like my FM multipath interference question (which nobody
*answered by the way), if I stop at a red light and my FM radio
*station cuts out, is the signal really still there? Why am I
*not receiving a signal if it is there? The "composite waveform"
*shows nothing but you say it is there. What's wrong with my
*radio?
**********8

Well in the first place I did not realize that question was directed at me. But if you wish I will take a feable stab at an answer. Most multipath problems I have dealt with are of the variety where the second signal is delayed. But if somehow one signal takes two paths and arrive at the same time then in order to cancel ther would have to be some sort of phase shift in one of the paths. The two paths are there in order for the phase difference to cancel. Because your signal goes away does not necessarily mean ther is no power at the reciever end.

> Maybe. There are a number of factors that could affect this.
A higher antenna/more power are only two of them. The problem
could be on your end too.

> 2) say I went to Radio Shack and bought a ham transceiver without a
> license. If anyone found out that I was broadcasting w/o a license, what
> could they possibley do? how would they find out who I was? (sorry
> that's off topic)

There are two ways that come to mind. You tell someone
where you are, or someone uses a direction finder (DF)
and 'finds' you.
>
> 3) What's a whip and dipole anteanna?

A whip is a type of antenna, usually vertical and mounted
on a car/truck/whatever. A dipole can be horizontal or
vertical, is fed in the center by the feedline, and having
equal length sides. They are usually made resonant by
adjusting the length.

> 4) What is SWR?>

SWR means standing wave ratio, a ratio of the power
sent to the antenna, and that which is reflected because of
a mis-match in impedance.

> 5) What would be the expected range of a 4-watt handheld with like a 6"
> anteanna?

Anything from 100 yards to 5 - 6 miles, depending on
where you are and propagation.
>
> 6) (this kindof has to do with my limited understanding of SWR) say I
> found out my anteanna wasn't working very well (bad swr). what coud I do
> to fix it?

Tune the antenna. Adjust length for resonance, and match
impedances.
>
> 7) I can't use a TV anteanna for a CB, could I? (I have this huge TV
> antenna that I'd like to mount in our atic and use on my CB, but I'm not
> sure I can do that).

Nope, too easy! Antd the serious answer is that a TV antenna
is made for a completely different range of frequencies. The
length of the elements of the antenna are way too short.
>
> 8) why can't I just use RG-59 (CATV coax) to connect my anteanna to my
> CB? What's the difference between RG-59's 75-ohm to RG-6's 50-ohm?

You can use RG-6 for a feed line. The problem is that the
shield (braid) is made of aluminum and is difficult to solder
to. Another reason is that RG-6 has very poor RF shielding, not
a good thing at all for transmitting.

Most radios, and antennas are designed to have a 50 ohm
input or output impedance. To connect the radio (50 ohms Z)
to an antenna with 50 ohms Z, you want to use 50 ohm Z cable.
Everything 'matches', and you have a low SWR, meaning that
most of the power your radio puts out, gets to the antenna and
is radiated.
If you use 75 ohm Z cable between a 50 ohm Z radio and a
50 ohm Z antenna, your SWR goes to about 1.5:1. Not all that
bad actually, but still not desirable.
This is a very simple explanation of a complex subject, so
it isn't complete by any means.

Do a search for qibla10.exe.

This is a program designed for locating Mecca from any location on
earth. It has a secondary feature allowing you to input your current
location and a second location then returns the direction from current
to the second.

Hope this helps
Nate

twistedhed,
Only going on what their advertising says, they are no worse
than many of the other companies selling antennas. I think a lot
of the claims they amake are rediculous though. Never believe
antenna gain figures from antenna manufaturors, they're all over
inflated, and inconsistant. But then, they aren't any worse than
all the rest.

I'll tell ya what. I have a very basic homebrew tube type amplifier. 1 6LQ6 driving 3MJ6's and the amp sounds clean as can be. If you can find a similar setup(which i'm sure you can) in an amplifier you will definately be happy with it. The one i have i just let cruise at 60 watts dead key and let it swing. it does about a very honest 300 watts peak. The amp has a tremendous audio punch that is very clean.

Theres a lot of Mustangs and Corvettes for sale in my paper too..I guess they suck..Think I`ll buy a Tempo..Theres less ads for those so it must be better...LOL....Ever hear of upgrading?

I hope I did`nt brain my damage.

6186. Does anyone know this radio? looking for it

I once had an old Johnson base with 40 channels, it was an older radio, it had 5 lights for the signal strength meter, I have no idea what number it was. It had the volume control, squelch, anl switch, a 3 posision switch I don't remember what it was, then a PA/CB switch, then the mic and the the speaker going across the bottom of the front, and the channel sellecter was just above the volume and squelch and the read out for channel and the signal meter was above that I believe. It was a good sized radio, and I think it had the moble power input on the back, along with AC operation but it was too big for moble use. Mine STB so if anyone can help me find one, or refresh my memory on the moddle, I would apreciate it ever so much. John

The 50 and the 75 ohms is the characteristic impedance of the transmission line...
As far as the TV antenna... it's simply not tuned for the CB band and therefor will not work.

"Daniel Friedrichs" <dan@willinet.net> wrote in message news:394A99C3.7BC6F9F5@willinet.net...

6192. Harada antenna question

Newsgroup: rec.radio.cb
Date: 2000-06-16 00:00:00 UTC
From: 95GT aod-e <leadfoot@downtown.org>
Message-ID: <FpA25.192223$MB.3550644@news6.giganews.com>
Source record: 39965

I'm looking into getting the Harada AM/FM CB antenna to replace my magnetic mount Radio Shack 52" whip. I mainly use the cb while traveling, i.e.. traffic reports, local info. Anyone have any experience with this antenna, good or bad? I'm trying to eliminate having a separate cb antenna on the car. Any other antennas out there besides Harada that accomplish the same thing?

TIA.
